

# Product registration during DOM integration at Nikhef

*Daan van Eijk*  
Fred Schimmel  
Rene de Boer

Nikhef KM3NeT Group Meeting  
March 10 2015

Glass, support structures, support structure assembly

PMT mounting

QA/QC

Assembly tables

ESD floor

# Why register products?

- Two goals:

## 1. DAQ:

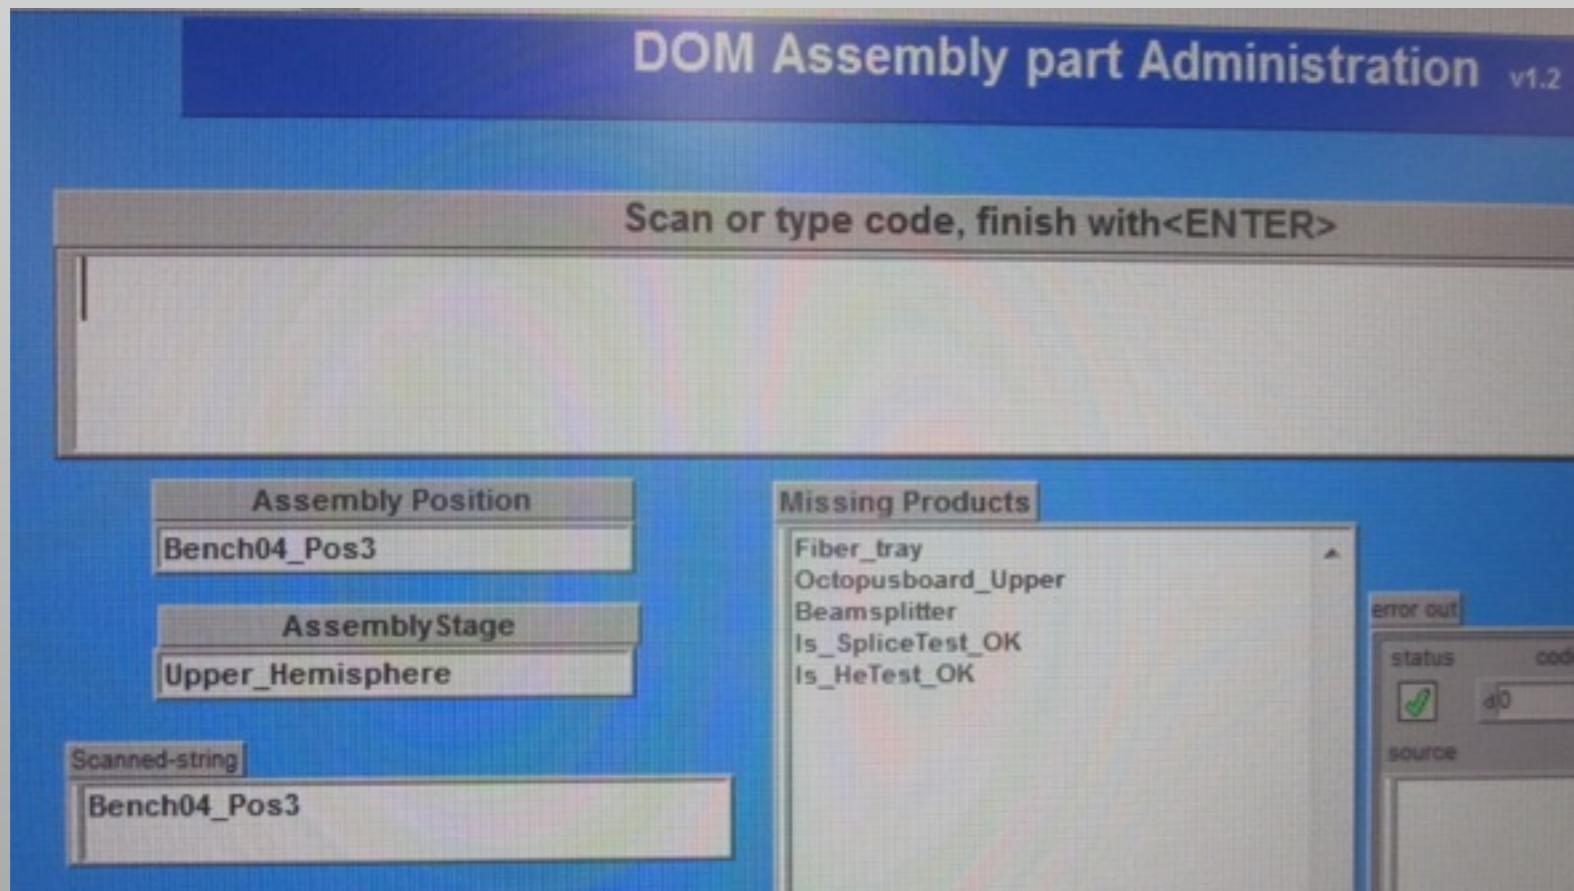

- Which CLB, piezo, nano beacon, Octopus boards?
- Which PMT is where?

## 2. QA/QC:

- To trace (batches of) products back if we ever find a problem with (certain) DOMs

- A PC with two LabView VI's running that reads from and writes to a (local!) Access database:
  - Overview program (reads current state of Bench Positions)
  - Product registration program (writes to DB)
- We make use of a QR-code scanner connected as keyboard input

Assembly Position	Assembly Stage
Bench01_Pos1	Upp_Hemisph+Support
Bench01_Pos2	Low_Hemisph+Support
Bench01_Pos3	Upp_Hemisph+Support
Bench01_Pos4	Low_Hemisph+Support
Bench02_Pos1	Upp_Hemisph+Support
Bench02_Pos2	Low_Hemisph+Support
Bench02_Pos3	Upp_Hemisph+Support
Bench02_Pos4	Low_Hemisph+Support

Bench06_Pos4	Upper_Hemisphere
Core_Assembly1	NONE
Core_Assembly2	Upper_Support

# Main objects

- The VI's work with the following main “objects”
  - Bench Positions
  - Assembly Stages
  - Actions

- Bench01\_Pos1 -  
Bench01\_Pos4

- ...

- Bench06\_Pos1 -  
Bench06\_Pos4

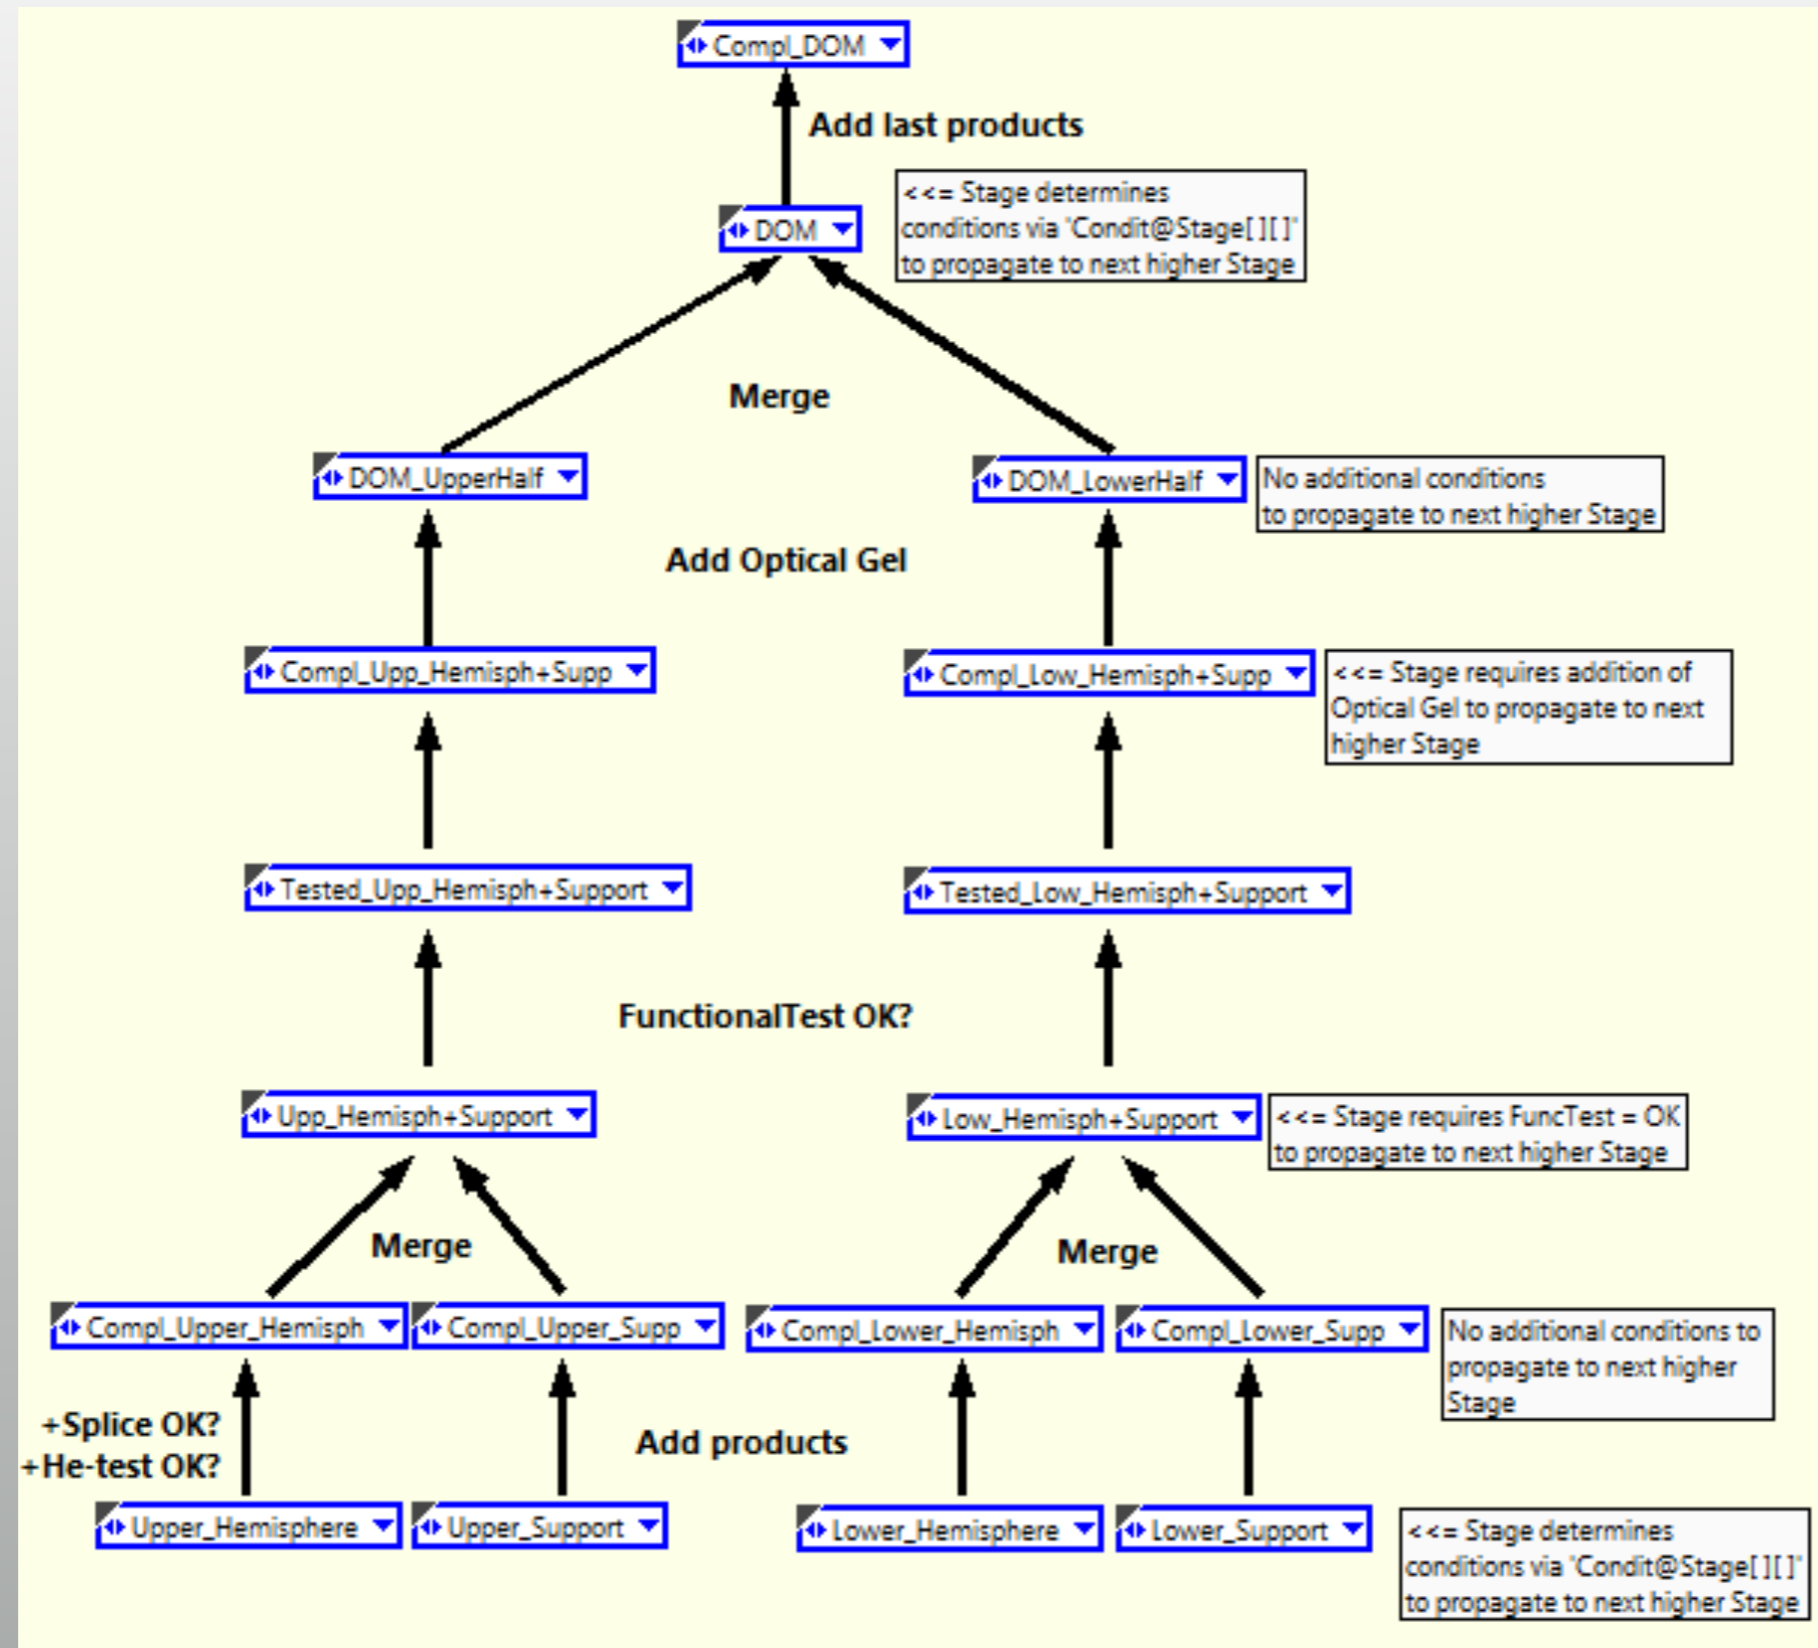

- Core\_Assembly1 -  
Core\_Assembly2

- Store01\_Pos01 -  
Store01\_Pos10

# Assembly Stages

- **Merge**

- Usage: scan <<Merge>>, scan <<1st bench pos>>, scan <<2nd bench pos>>
- In database, it cuts the products in the row from <<2nd bench pos>> and pastes them to their corresponding columns in the row for <<1st bench pos>>, filling the 'gaps'.
- Check on Assembly Stages to see if Merge is allowed
- <<2nd bench pos>> Assembly Stage changed to "None" —> position is free

- **To Storage**

- Usage: scan <<bench pos>>, scan <<To Storage>>, scan <<store pos>>
- In database, it cuts all products in the row from <<bench pos>> and pastes to <<store pos>>
- <<bench pos>> Assembly Stage changed to "None" —> position is free

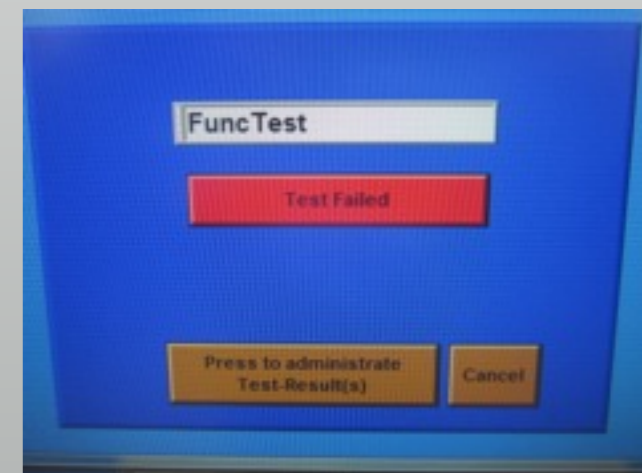

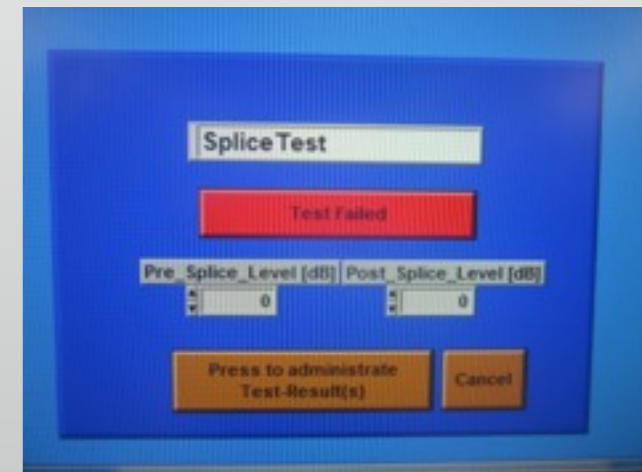

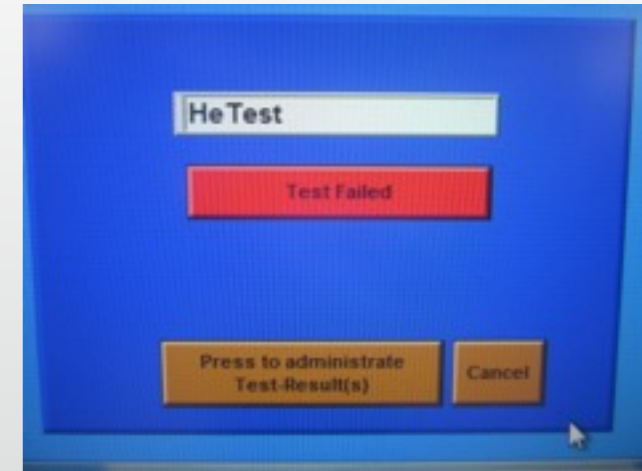

- **To Bench**

- Other way around from "To Storage"

- **Replace**

- Usage: scan <<Replace>>, program will ask what product needs replacement at this <<Bench Pos>>. Select the product. The program will ask for the new UPI.

- **He Test:**

- Usage: scan <<He Test>>, click “Test Failed” to change the dialog to “Test Passed” and press <<administrate>>

- **Splice Test:**

- Idem, but also enter optical attenuation before and after splice

- **Func Test:**

- As He Test
- Work to be done here. Still awaiting an official Test Procedure (Giorgio?). What do we want to register?
- And is this the way to register, or do we want dedicated Functional Test sheets to be parsed to KM3NeT DB?

- UPI administration
- Operator
- Timestamp

Rows: a row for every bench position

Columns: bench position, assembly stage, products, tests

A screenshot of a database interface showing a list of tables. The title is 'Tables' with an upward arrow icon. The list includes: Applied\_UPI\_List, DOM\_Assembly\_Operator, DOM\_Assembly\_Timestamp, DOM\_Assembly\_UPI\_Admin, Finished\_DOM\_Operator, Finished\_DOM\_Timestamp, and Finished\_DOM\_UPI\_Admin. Each table name is preceded by a small grid icon.

- 
- Finished DOM UPI
  - Finished DOM operator
  - Finished DOM timestamp

Rows: a row for every completed DOM

Columns: products, tests

- 
- Applied UPI list

Rows: a row for every unique product (no duplicates allowed!!!)

Columns: UPI

Microsoft Access - KMinet\_DOM\_DB: Database (Access 2002 - 2003 file format) - Microsoft Access

# VI is integration checklist

- Every Assembly Stage demands a number of products and/or tests to advance to the next Assembly Stage
- This is represented in the Missing Products List
  - Note: A test is treated as a product in this case

- Integration of the PMTs is special:
  - We also need to record the position in the mechanical structure
- Whenever a PMT QR is scanned, the VI tells the user he/she should scan a position first, and only then scan the PMT QR.
- Only then will a PMT *position* disappear from the Missing Product List

# Usage of local database

- Currently for DOM test setup (Linux system):
  - Python script to dump UPI table from Access to CSV file.
    - If someone has a better idea, please...
  - Read the CSV file, store rows as python lists
  - Do whatever you want:
    - Write to Excel/XML file (for upload of integration info to KM3NeT DB)
    - Get PMT HV settings from KM3NeT DB
      - See example at `/home/dom0user/Documents/PMT_HV_settings/Get_PMT_HV_settings.py` on kennet
    - ...

# For DOM testers

- Very important to note which DOM half you're picking up from which Bench Position
- You need that information to get correct PMT HV settings from KM3NeT DB
- Very important to put back the DOM half at its original position!

- When mounting an upper hemisphere on a Bench Position, we decide *beforehand* which DOM this upper hemisphere is going to be.
- Do we still want to keep a local count? This number is NOT used in our local DB nor in the KM3NeT DB
- Only used so far in the tests —> better to use UPI?
- Then how to identify lower halves?
- Do we need keep halves together?

Integrate SFP channel 38C!!!

# Conclusions

- At Nikhef, we use a Windows PC with a Tabview VI to register products during DOM integration
- Note which DOM (half) you pick up from which Bench Position before testing
- Be sure to put back the DOM (half) at the correct Bench Position after testing
- To do:
  - What and how do we want to register for tests?

# PMT mounting

Slightly off-topic, but VERY useful and safe for PMT integration!
