

# Quad test beam update: mean residuals

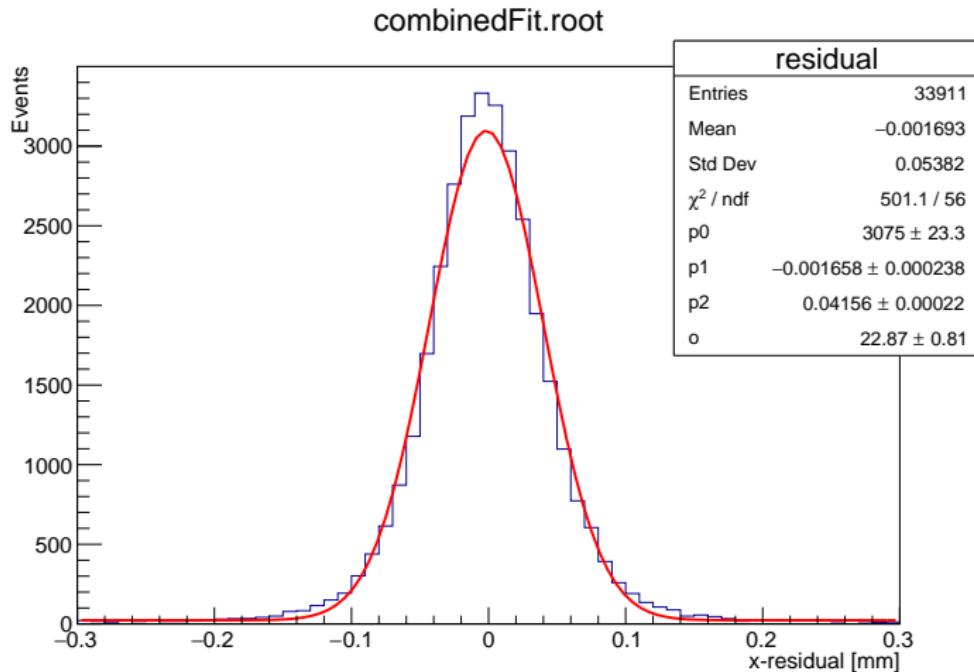

Kees Ligtenberg

Lepcol meeting

June 3, 2019

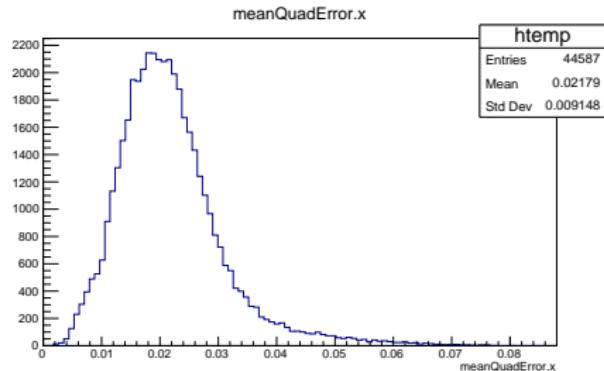

# Mean distance from quad to telescope track

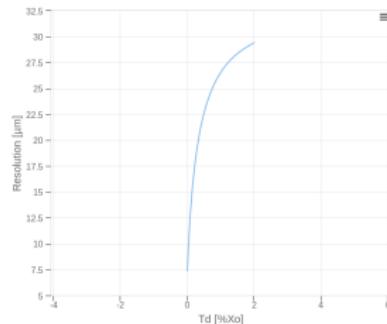

fitted with Gaussian + offset

# Error of mean quad position and telescope fit

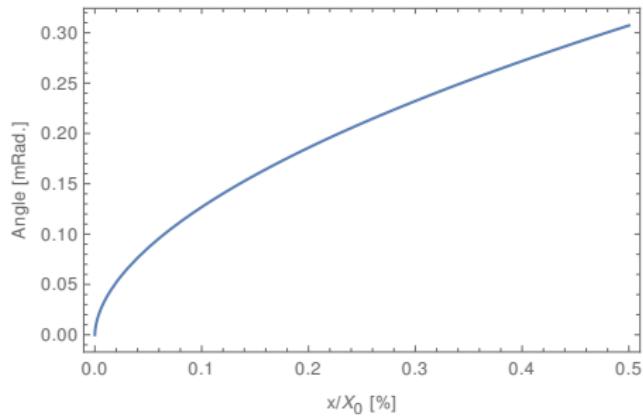

# Error on telescope track prediction

	$X_0$	$d$	Thickness
Argon	117 m	$\sim 10$ cm	0.09 % $X_0$
Kapton	286 mm	$2 \times 50$ $\mu\text{m}$	0.035 % $X_0$
Air	304 m	360 mm	0.12 % $X_0$
Telescope per plane (included in graph)			0.075 % $X_0$
Copper	14.35 mm	50 $\mu\text{m}$	0.35 % $X_0$

Track fit in analysis does not take multiple scattering into account, so the telescope error in the analysis is too small

# Scattering of 2.5 GeV electrons

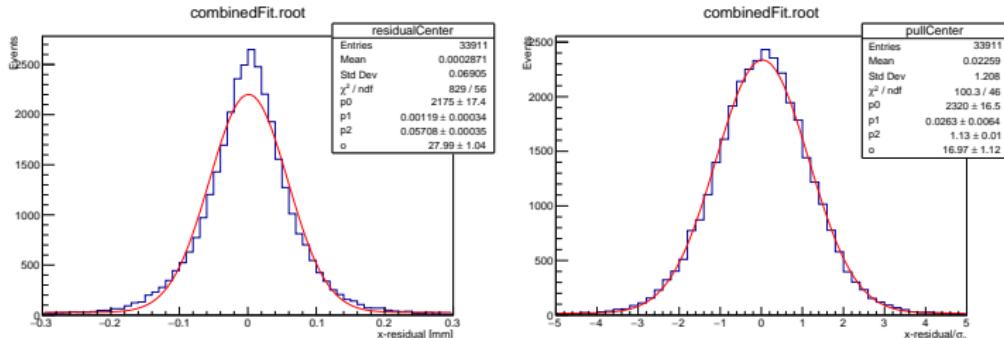

# Pull of distance from quad to telescope track

$\sigma_{\text{fit}} = 42 \mu\text{m}$  and pull is 1.6, so 33  $\mu\text{m}$  unaccounted for

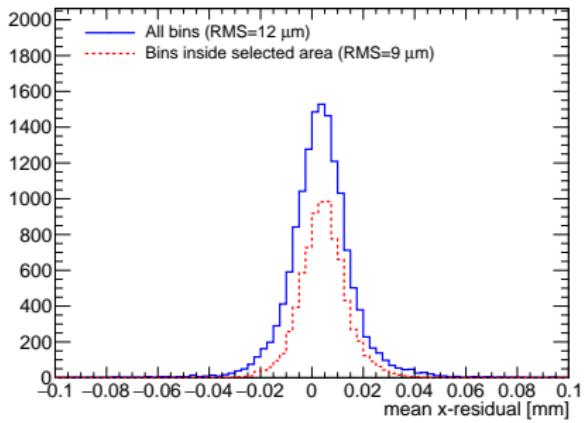

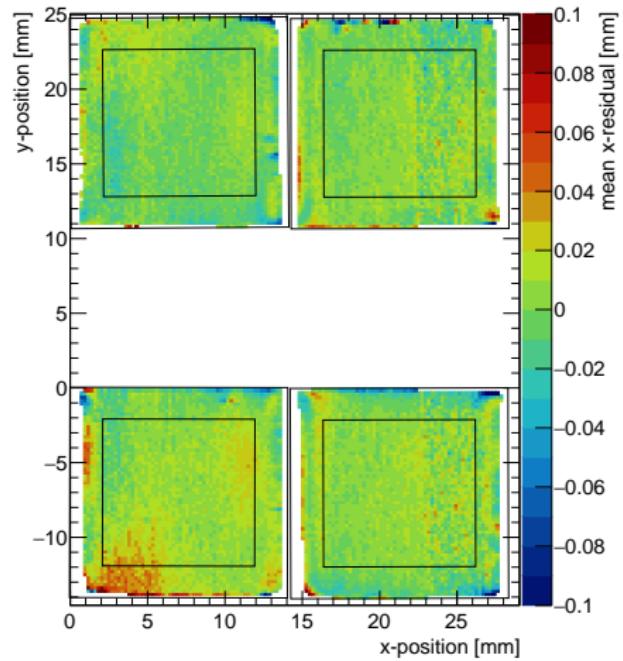

# Difference of two partial fits

Fit first three telescope plane together with the first two chips and the last two telescope planes together with the last two chips and calculate their difference in the center of the quad

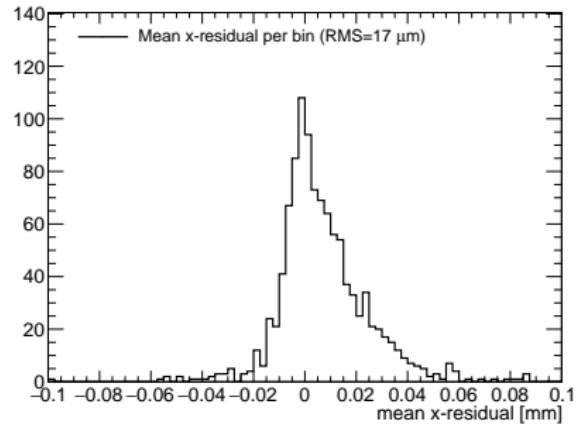

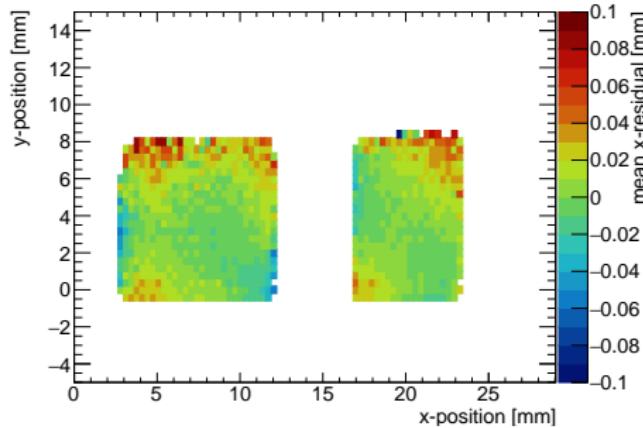

$\sigma_{\text{fit}} = 57 \mu\text{m}$  and pull is 1.13, so 26.5  $\mu\text{m}$  unaccounted for  
Improved by  $\sqrt{33^2 - 26.5^2} = 20 \mu\text{m}$ : is this multiple scattering?

# Deformations in the pixel plane

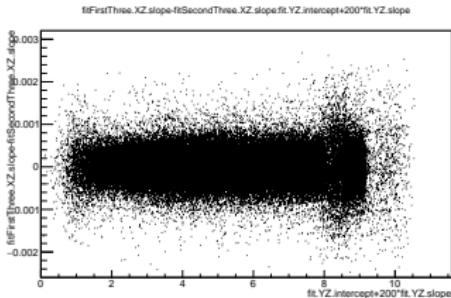

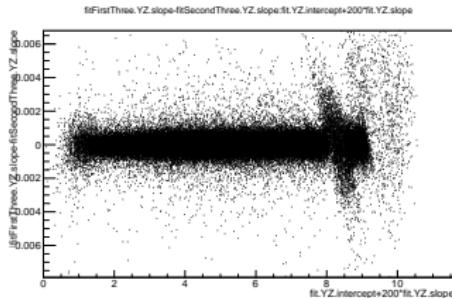

# x-deformations in the drift direction

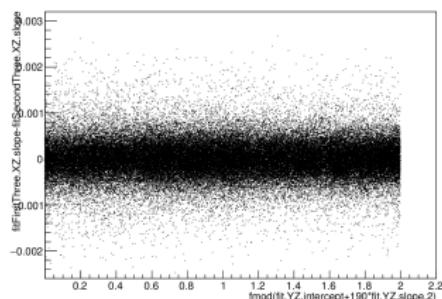

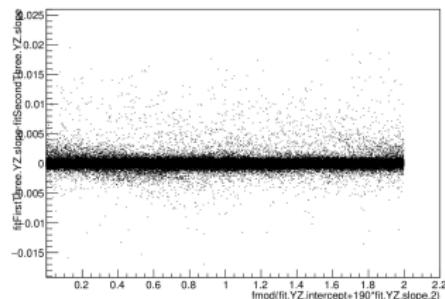

After correction for bins with more than 500 entries

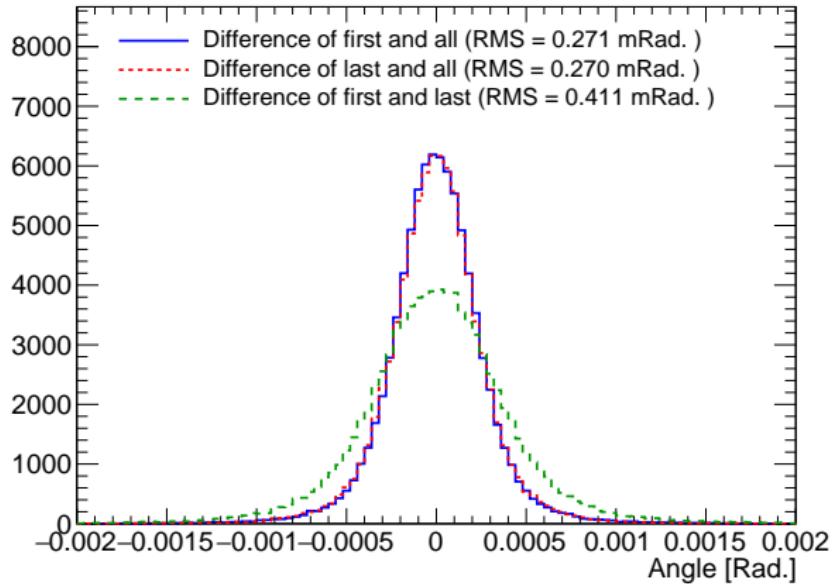

# Multiple scattering

No indication for scattering on e.g. field wires  
And after doing the modulus2:

# Scattering

$$\sigma_{\text{first-all}} \approx \sigma_{\text{last-all}} = 0.270 \text{ mRad}$$

$$\sigma_{\text{first-last}} = 0.418 \text{ mRad}$$

$$\sqrt{2}\sigma_{\text{first-all}} = 0.382 \text{ mRad}$$

# Calculation of scattering

Calculate measurement error using:

- $\sigma_{\text{first}} = \sigma_{\text{last}}$
- Scattering in DUT:  $\theta_{\text{DUT}}$
- $\theta_{\text{DUT}}$  only affects total angle by  $\theta_{\text{DUT}}/2$
- Neglect  $\sigma_{\text{all}}$

$$\theta_{\text{first}} - \theta_{\text{all}} \rightarrow \sigma_{\text{first-all}}^2 = \sigma_{\text{first}}^2 + \sigma_{\text{all}}^2 + \sigma_{\text{DUT}}^2/4$$
$$\theta_{\text{first}} - \theta_{\text{last}} \rightarrow \sigma_{\text{first-last}}^2 = 2\sigma_{\text{first}}^2 + \sigma_{\text{DUT}}^2$$

Solve for  $\sigma_{\text{first-all}} = 0.270 \text{ mRad}$  and  $\sigma_{\text{first-last}} = 0.418 \text{ mRad} \rightarrow$   
 $\sigma_{\text{first}} = \sigma_{\text{last}} = 0.242 \text{ mRad}$  and  $\sigma_{\text{DUT}} = 0.241 \text{ mRad}$   
Or in terms of thickness  $0.32\%X_0$

# Quad resolution

The demonstrated resolution is 42 µm

- 26 µm from quad and statistical telescope error?
- 32 µm from other contributions:
  - ▶ 9 µm from deformations in pixel plane
  - ▶ 17 µm from deformations in drift direction
  - ▶ 26 µm from Telescope / other unknown contributions?

# x residual by ToT
