Advantages of $2 \rightarrow 2$ processes

Advantages of $2 \rightarrow 2$ processes

• $2 \rightarrow 1$ process :

- Resulting particle has to be at small q_T
- \rightarrow likely difficult to measure at colliders, in particular for mesons (less for H, W, Z)
- Hard scale has to be the particle mass : $Q^2 = M^2$

 \rightarrow does not help to study TMD evolution

Advantages of $2 \rightarrow 2$ processes

• $2 \rightarrow 1$ process :

- Resulting particle has to be at small q_T
- \rightarrow likely difficult to measure at colliders, in particular for mesons (less for H, W, Z)
- Hard scale has to be the particle mass : $Q^2 = M^2$ \rightarrow does not help to study TMD evolution
- Back-to-back (low q_T) 2 \rightarrow 2 process :
 - Produced particles can each have a large \vec{p}_T adding up to make a small \vec{q}_T for the pair. One can impose \vec{p}_T large enough for the particle to be detectable
 - This renders the TMD "region" ($q_T \ll Q$) as wide as we wish
 - Hard scale $Q^2 = (k_1 + k_2)^2$ can be tuned to study the

QCD evolution of the TMDs

 $Q + \gamma$

Expected rates for back-to-back $Q + \gamma$

Expected rates for back-to-back $Q + \gamma$

• *qq* contribution negligible;

Expected rates for back-to-back $Q + \gamma$

• *qq* contribution negligible;

• CO (orange) smaller than CS (blue): isolation not needed for Υ

Expected rates for back-to-back $Q + \gamma$

• *qq* contribution negligible;

- CO (orange) smaller than CS (blue): isolation not needed for Υ
- At 14 TeV, $\sigma(J/\psi|\Upsilon + \gamma, Q > 20 \text{GeV}) \simeq 100 \text{fb}$; about half at 7 TeV

Expected rates for back-to-back $Q + \gamma$

- *qq* contribution negligible;
- CO (orange) smaller than CS (blue): isolation not needed for Υ
- At 14 TeV, $\sigma(J/\psi|\Upsilon + \gamma, Q > 20 \text{GeV}) \simeq 100 \text{fb}$; about half at 7 TeV
- With the $\mathcal{L} \simeq 20 \text{ fb}^{-1}$ of *pp* data on tape, one expects up to 2000 events.

Search for Higgs and Z Boson Decays to $J/\psi\gamma$ and $\Upsilon(nS)\gamma$ with the ATLAS Detector

G. Aad et al.*

(ATLAS Collaboration)

(Received 15 January 2015; published 26 March 2015)

A search for the decays of the Higgs and Z bosons to $J/\psi\gamma$ and $\Upsilon(nS)\gamma$ (n = 1, 2, 3) is performed with pp collision data samples corresponding to integrated luminosities of up to 20.3 fb⁻¹ collected at $\sqrt{s} = 8$ TeV with the ATLAS detector at the CERN Large Hadron Collider. No significant excess of events is observed above expected backgrounds and 95% C.L. upper limits are placed on the branching fractions. In the $J/\psi\gamma$ final state the limits are 1.5×10^{-3} and 2.6×10^{-6} for the Higgs and Z boson decays, respectively, while in the $\Upsilon(1S, 2S, 3S)\gamma$ final states the limits are $(1.3, 1.9, 1.3) \times 10^{-3}$ and $(3.4, 6.5, 5.4) \times 10^{-6}$, respectively.

$\Upsilon + Z$ cross sections

B. Gong, J.P. Lansberg, C. Lorcé, J.X. Wang, JHEP 1303 (2013) 115

• Rates similar for $\Upsilon + Z$ and $J/\psi + Z$ [Same for $Q + \gamma$ for $Q \gtrsim 20$ GeV]

June 3, 2016 21 / 28

$\Upsilon + Z$ cross sections

B. Gong, J.P. Lansberg, C. Lorcé, J.X. Wang, JHEP 1303 (2013) 115

• Rates similar for $\Upsilon + Z$ and $J/\psi + Z$ [Same for $Q + \gamma$ for $Q \gtrsim 20$ GeV]

• Potential probe of gluon TMDs as well

$\Upsilon + Z$ cross sections

B. Gong, J.P. Lansberg, C. Lorcé, J.X. Wang, JHEP 1303 (2013) 115

• Rates similar for $\Upsilon + Z$ and $J/\psi + Z$ [Same for $Q + \gamma$ for $Q \gtrsim 20$ GeV]

- Potential probe of gluon TMDs as well
- Rate clearly smaller than $Q + \gamma$ even at low P_T

$\Upsilon + Z$ and TMDs

JPL, C. Pisano, M. Schlegel

- $\Upsilon + Z @\sqrt{s} = 14$ TeV;
- Q = 120 GeV, Y = 0, $\theta = \pi/2$

 $Q + \gamma$

(日) (四) (三) (三)

$\Upsilon + Z$ and TMDs

JPL, C. Pisano, M. Schlegel

- $\Upsilon + Z @\sqrt{s} = 14$ TeV;
- Q = 120 GeV, Y = 0, $\theta = \pi/2$

Q + v

• $S_{q_T}^{(n)}$ smaller than for $Q + \gamma$

[one can integrate up to larger q_T , though]

$\Upsilon + Z$ and TMDs

JPL, C. Pisano, M. Schlegel

- $\Upsilon + Z @\sqrt{s} = 14$ TeV;
- Q = 120 GeV, $Y = 0, \theta = \pi/2$

Q + v

- $S_{q_T}^{(n)}$ smaller than for $Q + \gamma$ [one can integrate up to larger q_T , though]
- Naturally large Q: interest to study the scale evolution ?

• All allowed terms are nonzero (unlike $J/\psi + \gamma (A^h = 0)$)

 $d\sigma \propto A^{f} C[f_{1}^{g} f_{1}^{g}] + A^{h} C[w_{0}^{hh} h_{1}^{\perp g} h_{1}^{\perp g}]$ $+ B \Big[C[w_{2}^{fh} f_{1}^{g} h_{1}^{\perp g}] + C[w_{2}^{hf} h_{1}^{\perp g} f_{1}^{g}] \Big] \cos(2\phi) + C C[w_{4}^{hh} h_{1}^{\perp g} h_{1}^{\perp g}] \cos(4\phi)$

- The expressions for *A*-*D* are tractable (a little too long though to be shown in an useful manner)
- For typical kinematical configurations, A^h ≪ B ≪ A^f, C. As what regards A^h, the situation is similar to J/ψ + γ.

JPL, C. Pisano, F. Scarpa, work in progress

• All allowed terms are nonzero (unlike $J/\psi + \gamma (A^h = 0)$)

 $d\sigma \propto A^{f} \mathcal{C}[f_{1}^{g}f_{1}^{g}] + A^{h} \mathcal{C}[w_{0}^{hh} h_{1}^{\perp g} h_{1}^{\perp g}]$ $+ B \Big[\mathcal{C}[w_{2}^{fh} f_{1}^{g} h_{1}^{\perp g}] + \mathcal{C}[w_{2}^{hf} h_{1}^{\perp g} f_{1}^{g}] \Big] \cos(2\phi) + C \mathcal{C}[w_{4}^{hh} h_{1}^{\perp g} h_{1}^{\perp g}] \cos(4\phi)$

• The expressions for *A*-*D* are tractable (a little too long though to be shown in an useful manner)

 For typical kinematical configurations, A^h ≪ B ≪ A^f, C. As what regards A^h, the situation is similar to J/ψ + γ.

• For individual $P_T^{\psi} \gg M_{\psi}$, one has

$$A^f\sim 1\,;\,A^h\sim (M_\psi/P_T^\psi)^4\,;\,B\sim (M_\psi/P_T^\psi)^2\,;\,C\sim 1$$

$J/\psi + J/\psi$ azimuthal effects

JPL, C. Pisano, F. Scarpa, work in progress

• Using a simple model (+ positivity bound) :

$$f_1^g(x,k_T) = \frac{1}{\pi\beta} e^{-\frac{k_T^2}{\beta}} f_1^g(x) \quad \text{with } \beta = \langle k_T^2 \rangle$$

• One gets for $\mathcal{S}_{q_T}^{(n)}$

• TMD studies in the gluon sector are very promising

イロト イポト イヨト イヨト

- TMD studies in the gluon sector are very promising
- With lepton beams, only possible at an EIC

- TMD studies in the gluon sector are very promising
- With lepton beams, only possible at an EIC
- If we don't want to wait for 10 years, LHC can help, right now !

- TMD studies in the gluon sector are very promising
- With lepton beams, only possible at an EIC
- If we don't want to wait for 10 years, LHC can help, right now !
- Low $P_T \eta_c$ production [below $M_{\eta_c}/2$] is highly challenging,

maybe impossible with the current detectors

- Low $P_T \eta_c$ production [below $M_{\eta_c}/2$] is highly challenging,

maybe impossible with the current detectors

• Di-photon production is perhaps more tractable

but very challenging where the rates are high

- Back-to-back $J/\psi + \gamma$, $\Upsilon + \gamma$ and $J/\psi + J/\psi$ is certainly at reach
 - Already a couple of thousand events on tapes
 - $f_1^g(x, k_T, \mu)$ and $h_1^{\perp g}(x, k_T, \mu)$ can be determined separately
 - Q can even be tuned \rightarrow gluon TMD evolution

 $\mathcal{S}^{(0)}_{q_T}$: Model predictions for $\Upsilon+\gamma$ production at $\sqrt{s}=14$ TeV

 $Q = 20 \text{ GeV}, \qquad Y = 0, \qquad \theta_{CS} = \pi/2$

Models for f_1^g : assumed to be the same as for Unintegrated Gluon Distributions

- Set B: B0 solution to CCFM equation with input based on HERA data Jung et al., EPJC 70 (2010) 1237
- KMR: Formalism embodies both DGLAP and BFKL evolution equations Kimber, Martin, Ryskin, PRD 63 (2010) 114027
- CGC: Color Glass Condensate Model
 Dominguez, Qiu, Xiao, Yuan, PRD 85 (2012) 045003
 Metz, Zhou, PRD 84 (2011) 051503

 $\mathcal{S}_{q_T}^{(2,4)}$: Model predictions for $\Upsilon+\gamma$ production at $\sqrt{s}=14$ TeV

 $Q = 20 \text{ GeV}, \qquad Y = 0, \qquad \theta_{CS} = \pi/2$

 $h_1^{\perp g}$: predictions only in the CGC: in the other models saturated to its upper bound

 $S_{q_T}^{(2,4)}$ smaller than $S_{q_T}^{(0)}$: can be integrated up to $q_T = 10 \text{ GeV}$

 $\begin{array}{lll} 2.0\%\,({\rm KMR}) < & |\int\,{\rm d}q_T^2 \mathcal{S}_{q_T}^{(2)}| & < 2.9\%\,({\rm Gauss}) \\ \\ 0.3\%\,({\rm CGC}) < & \int\,{\rm d}q_T^2\,\mathcal{S}_{q_T}^{(4)} & < 1.2\%\,({\rm Gauss}) \end{array}$

Possible determination of the shape of f_1^g and verification of a non-zero $h_1^{\perp g}$
