Where Are All the 'Sparticles' That Could Explain What's Wrong with the Universe?

By Paul Sutter March 01, 2019 Strange News

High SUSY masses are assumed to be bad...

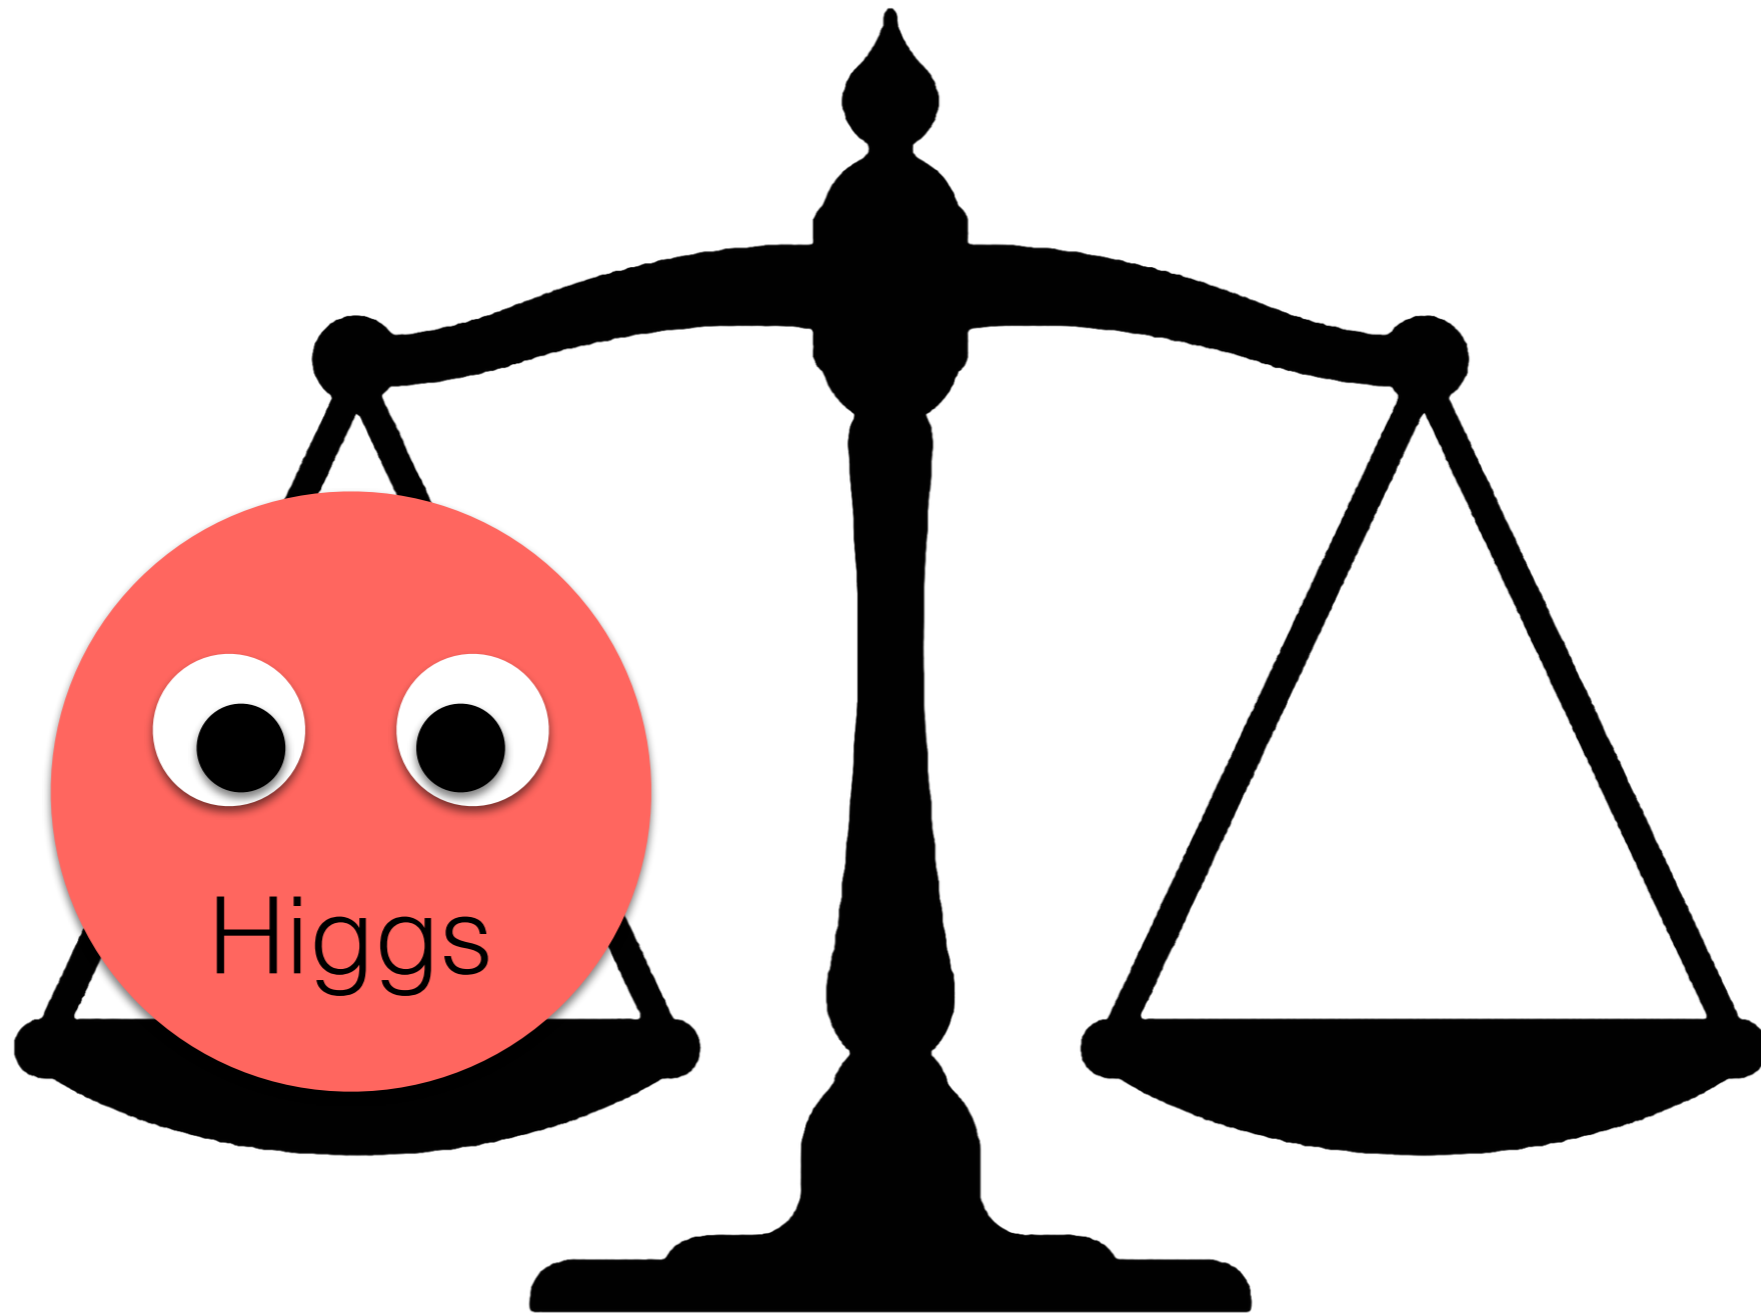

Why?

High SUSY masses are assumed to be bad...

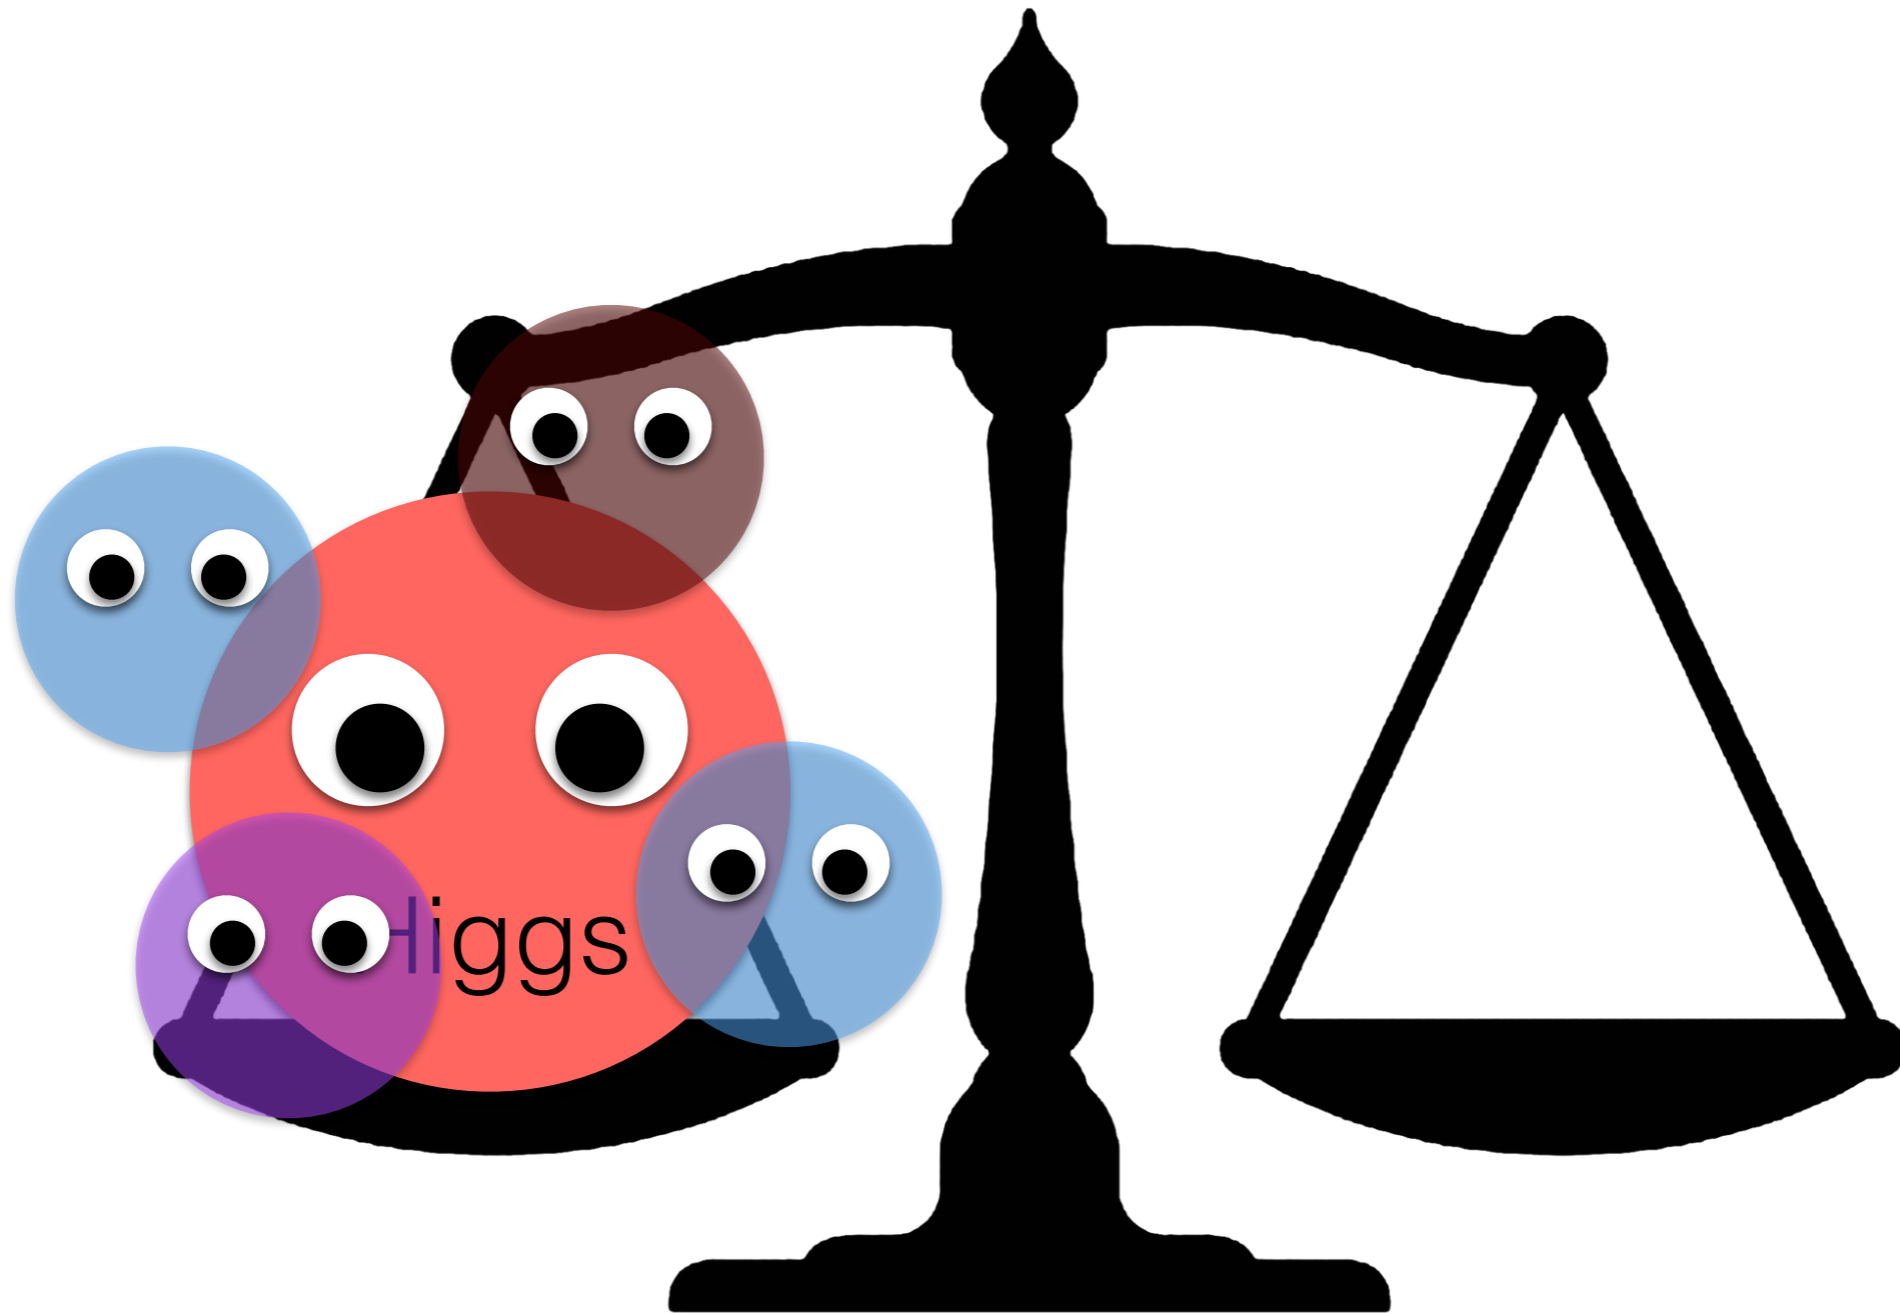

Why?

The fine-tuning problem

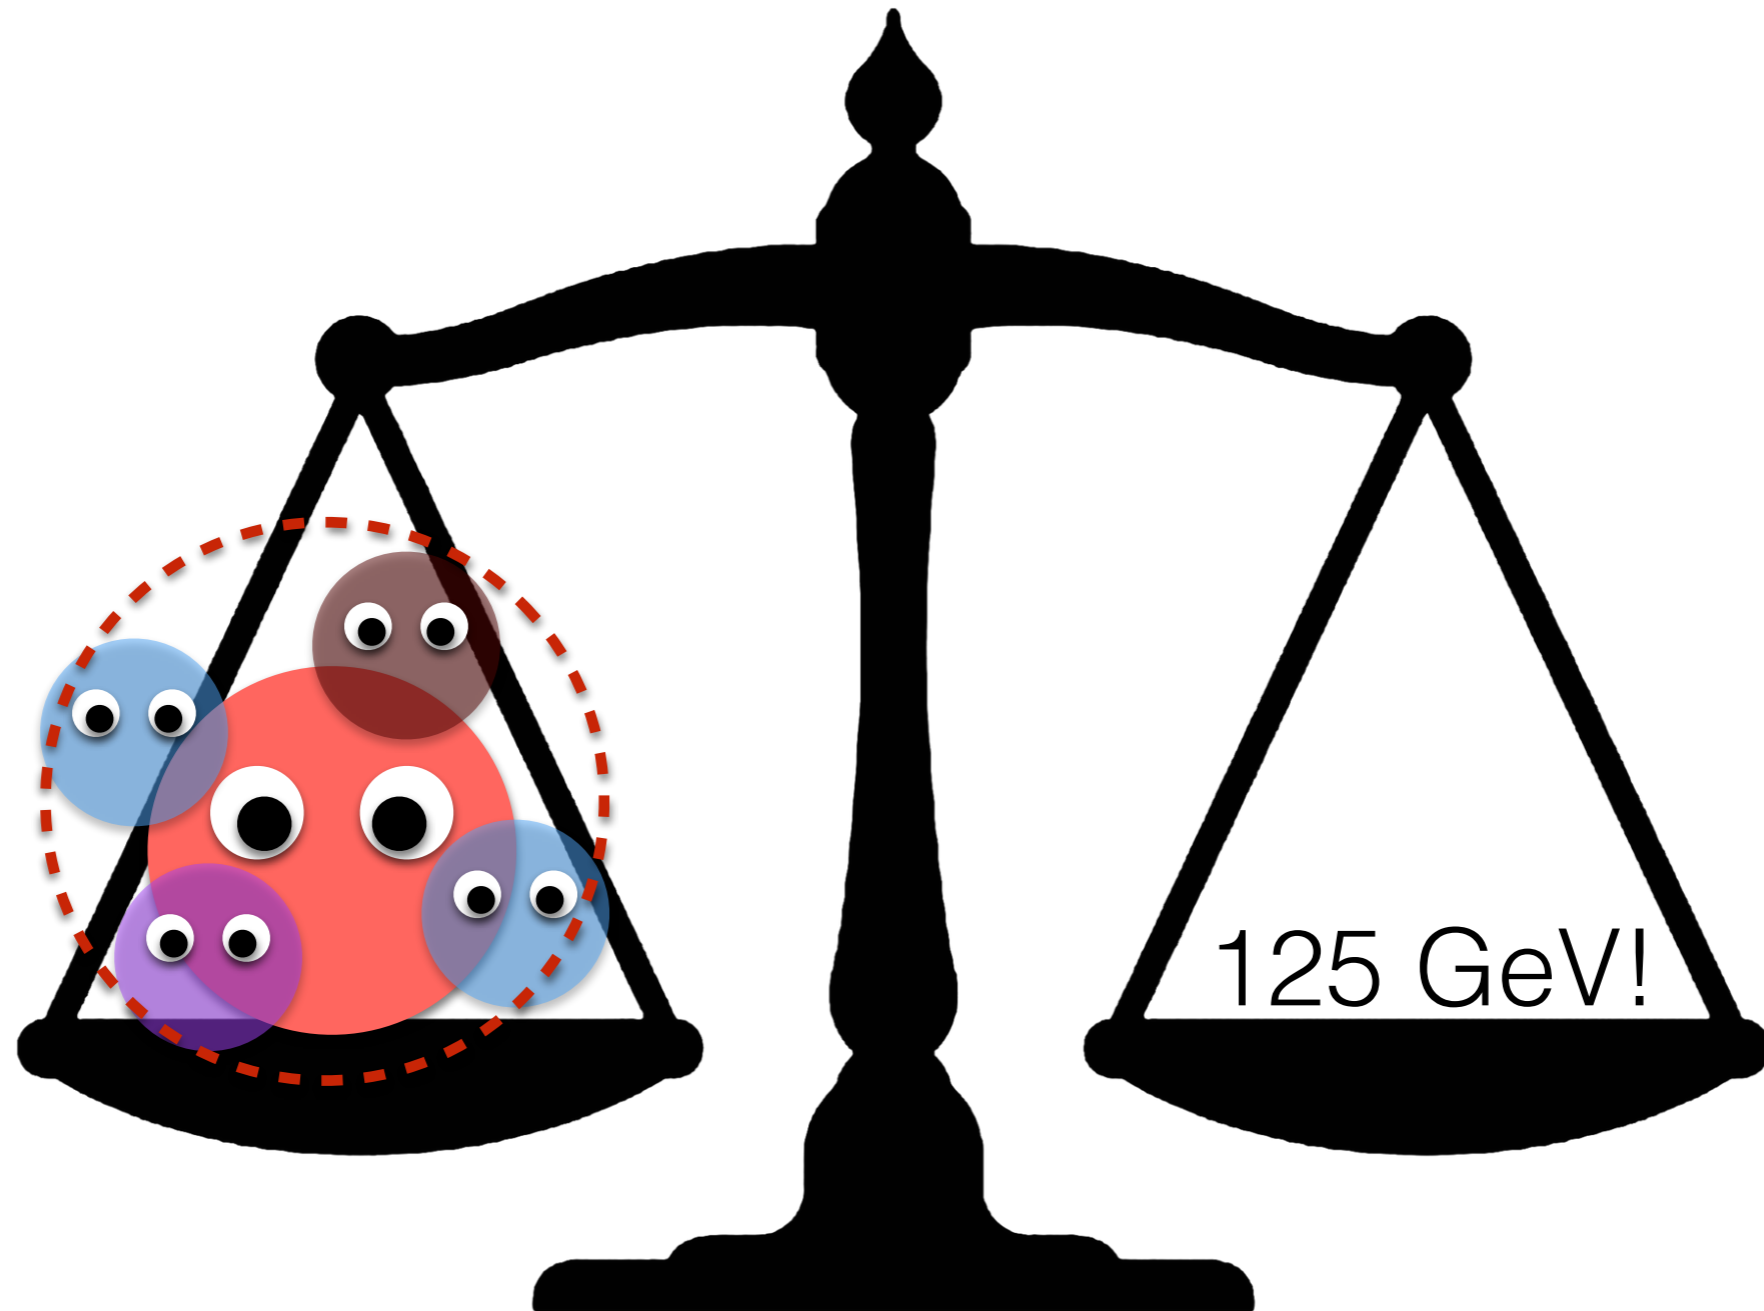

What do we measure?

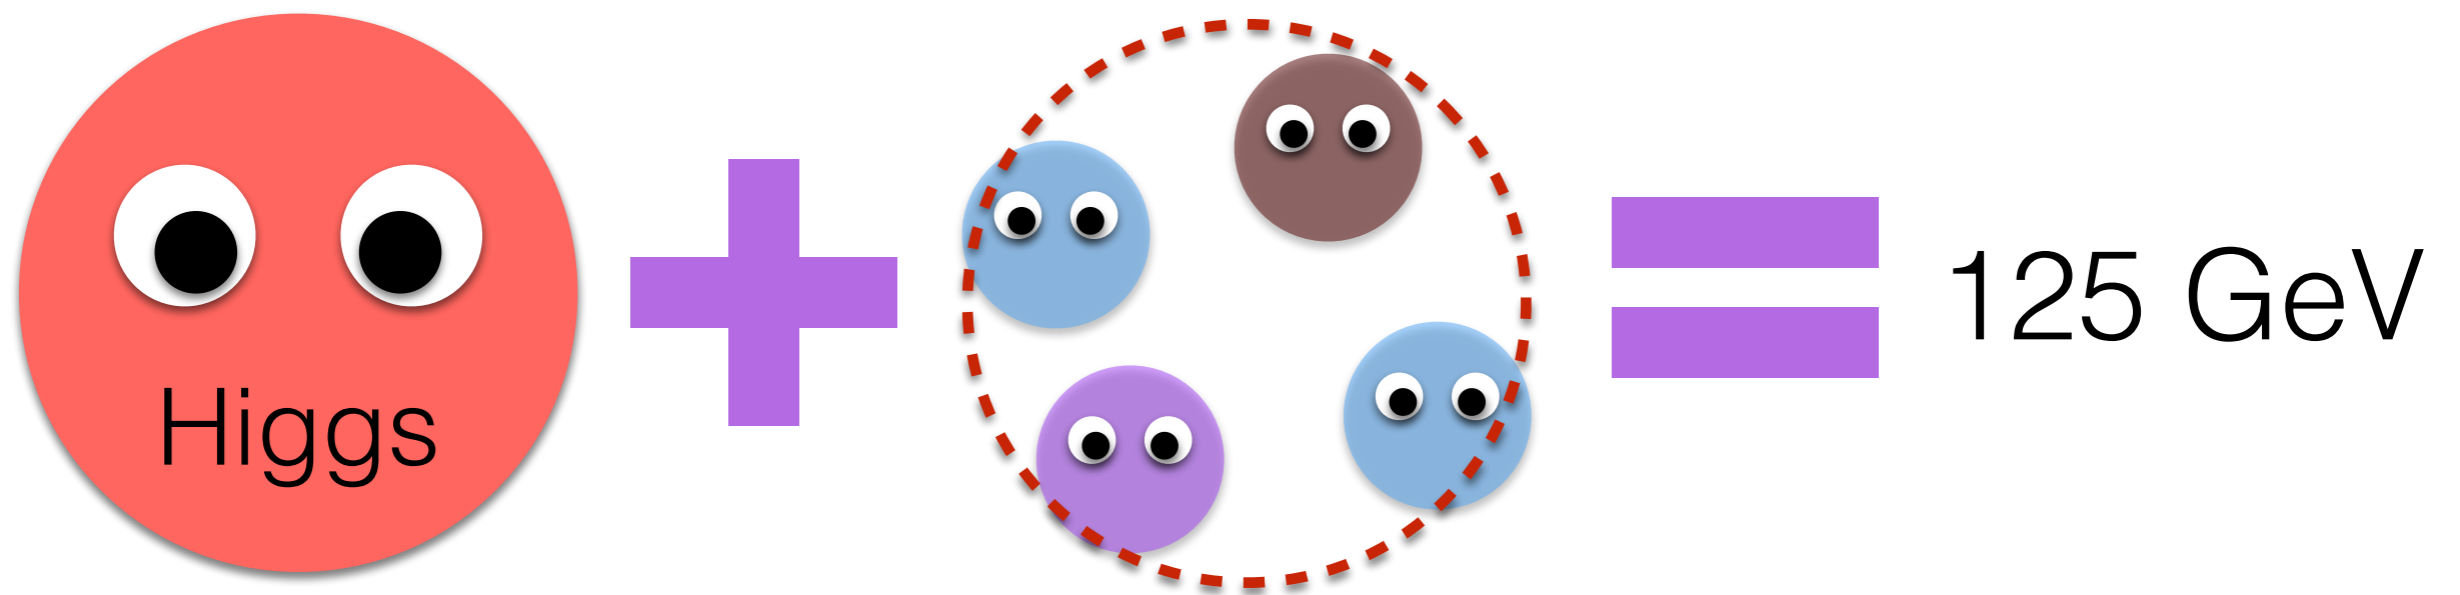

What do we measure?

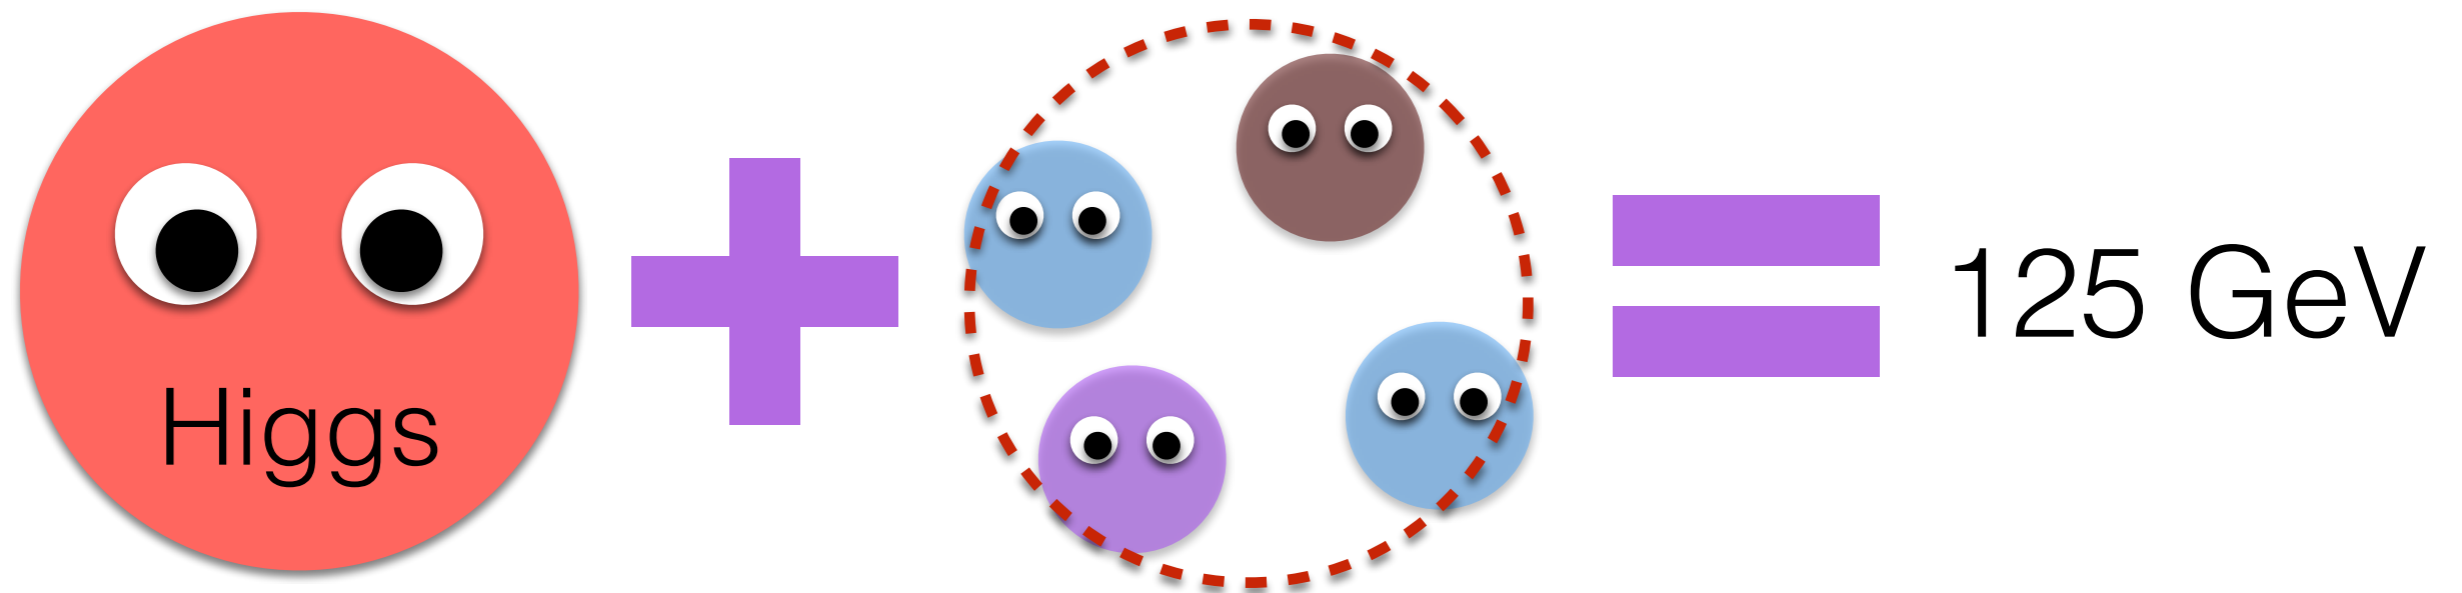

What do we measure?

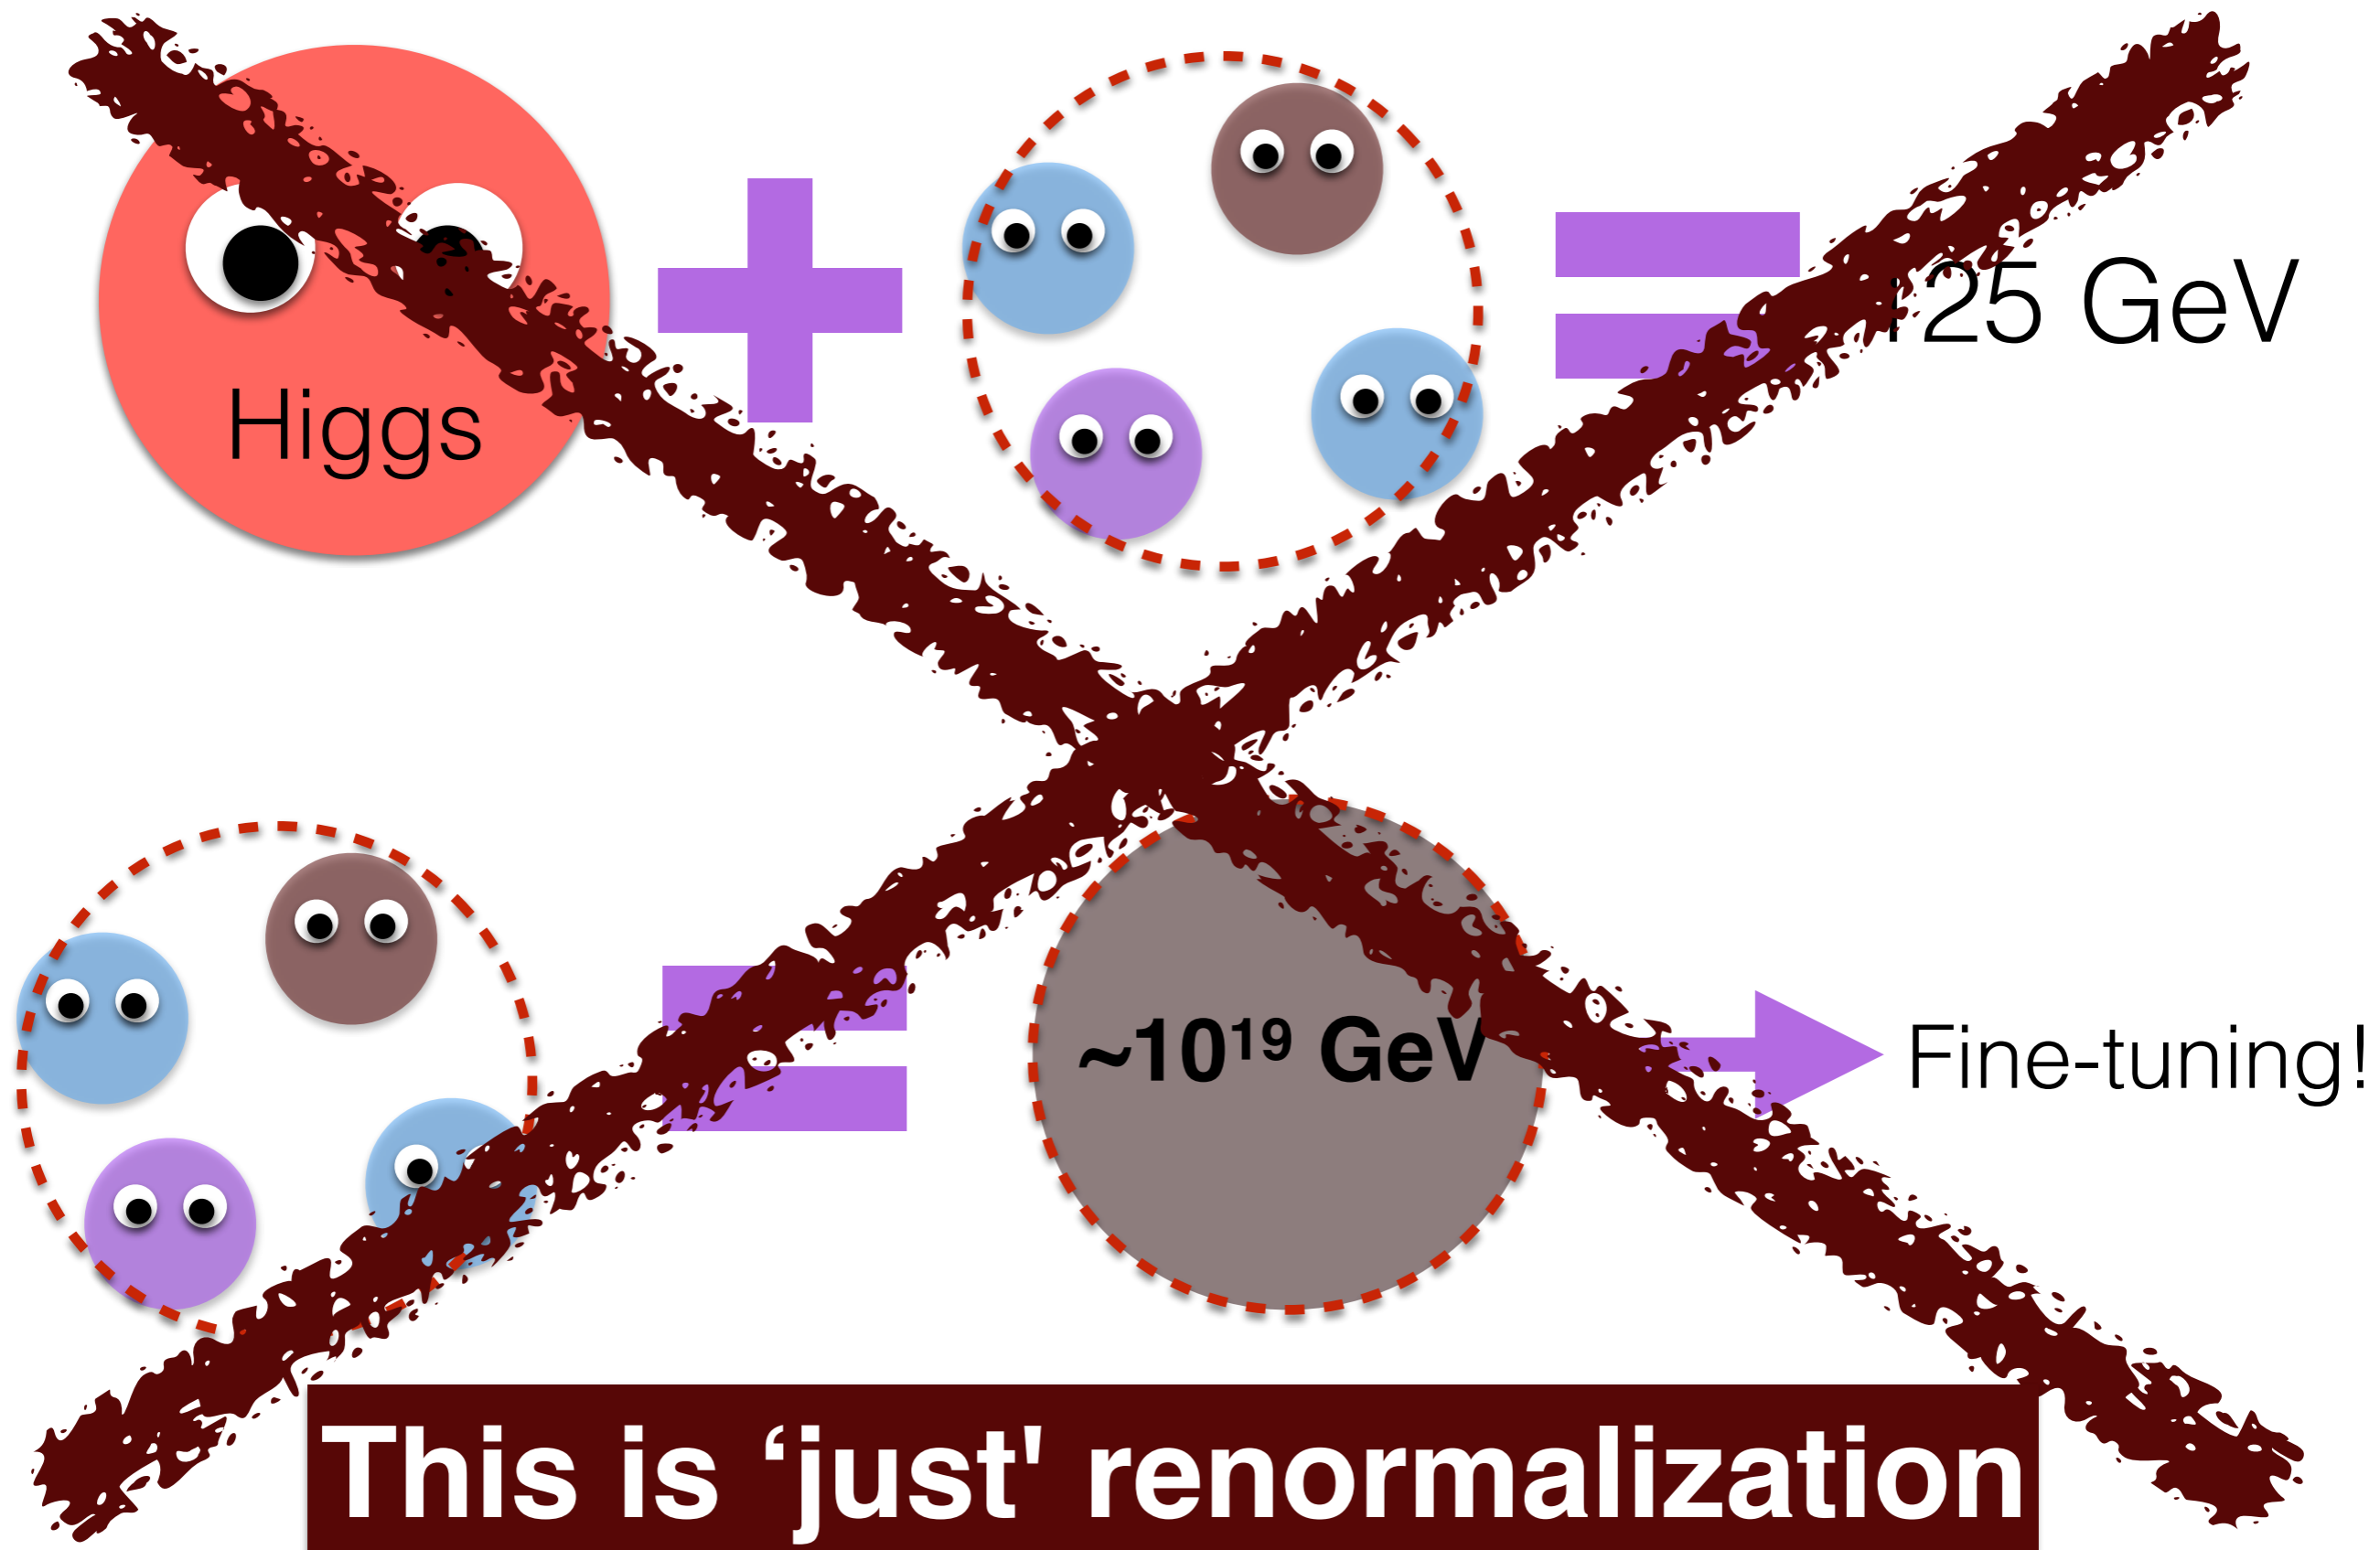

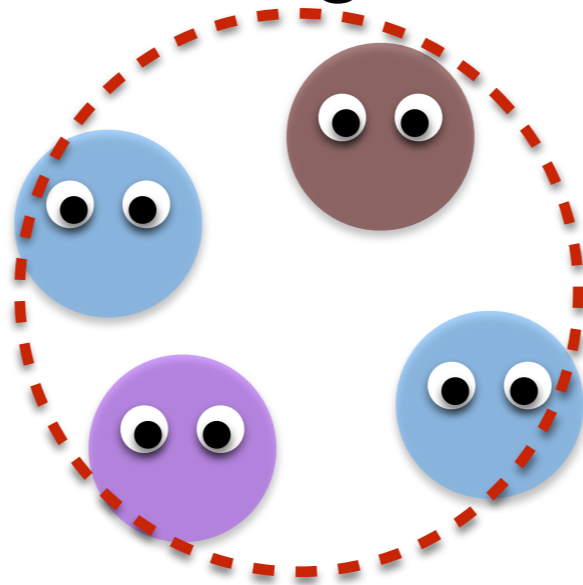

Usual story:

Usual story:

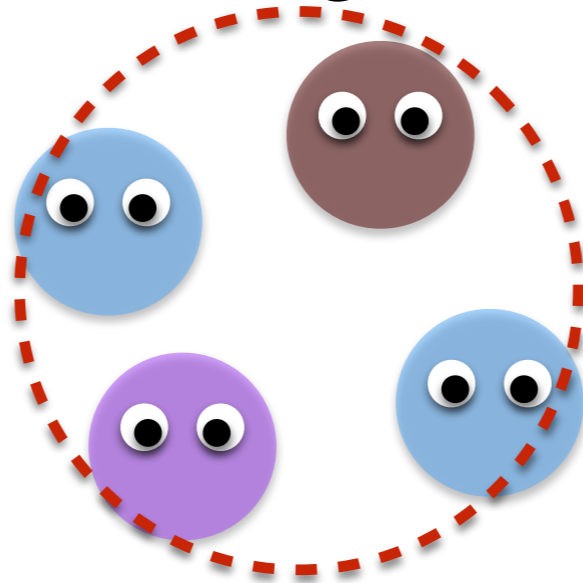

Only if the ingredients of

are observable, you **could** have fine-tuning

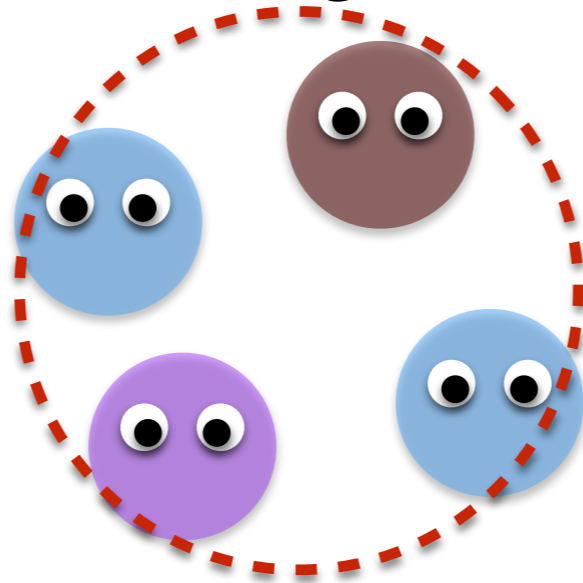

Only if the ingredients of

are observable, you **could** have fine-tuning

e.g. new physics at Planck scale...

Only if the ingredients of

are observable, you **could** have fine-tuning

e.g. new physics at Planck scale...

...or new SUSY particles

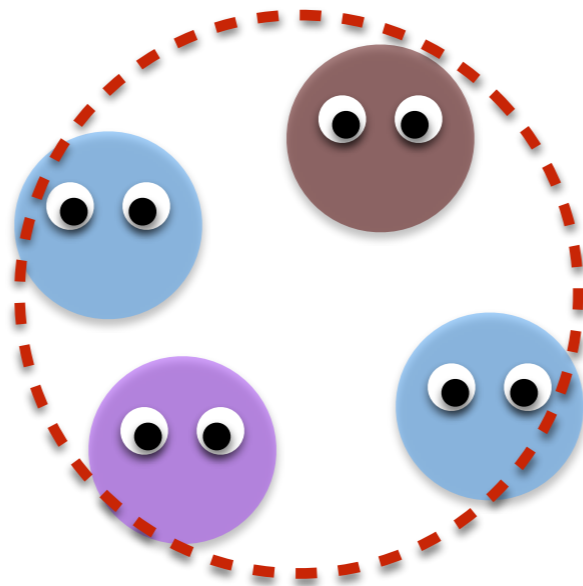

Fine-tuning is...

...when one observable changes a lot as a consequence of a tiny change in other observables

Fine-tuning is...

...when one observable changes a lot as a consequence of a tiny change in other observables

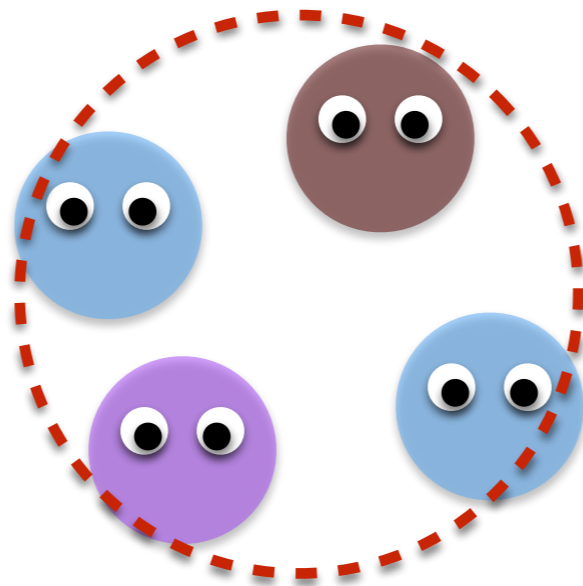

The Higgs boson 'feels'
the presence of a new scale

Fine-tuning is...

...when one observable changes a lot as a consequence of a tiny change in other observables

The Higgs boson 'feels'
the presence of a new scale

Either in the form of:

1. A high scale model (GUT)
2. An effective theory (EFT)

We want to know:

1. Is SUSY fine-tuned?

Should we be worried about the LHC limits?

2. Where and how should we look next?

Fine-tuning aside, are there holes in the experimental coverage?

We want to know:

1. Is SUSY fine-tuned?

Should we be worried about the LHC limits?

2. Where and how should we look next?

Fine-tuning aside, are there holes in the experimental coverage?

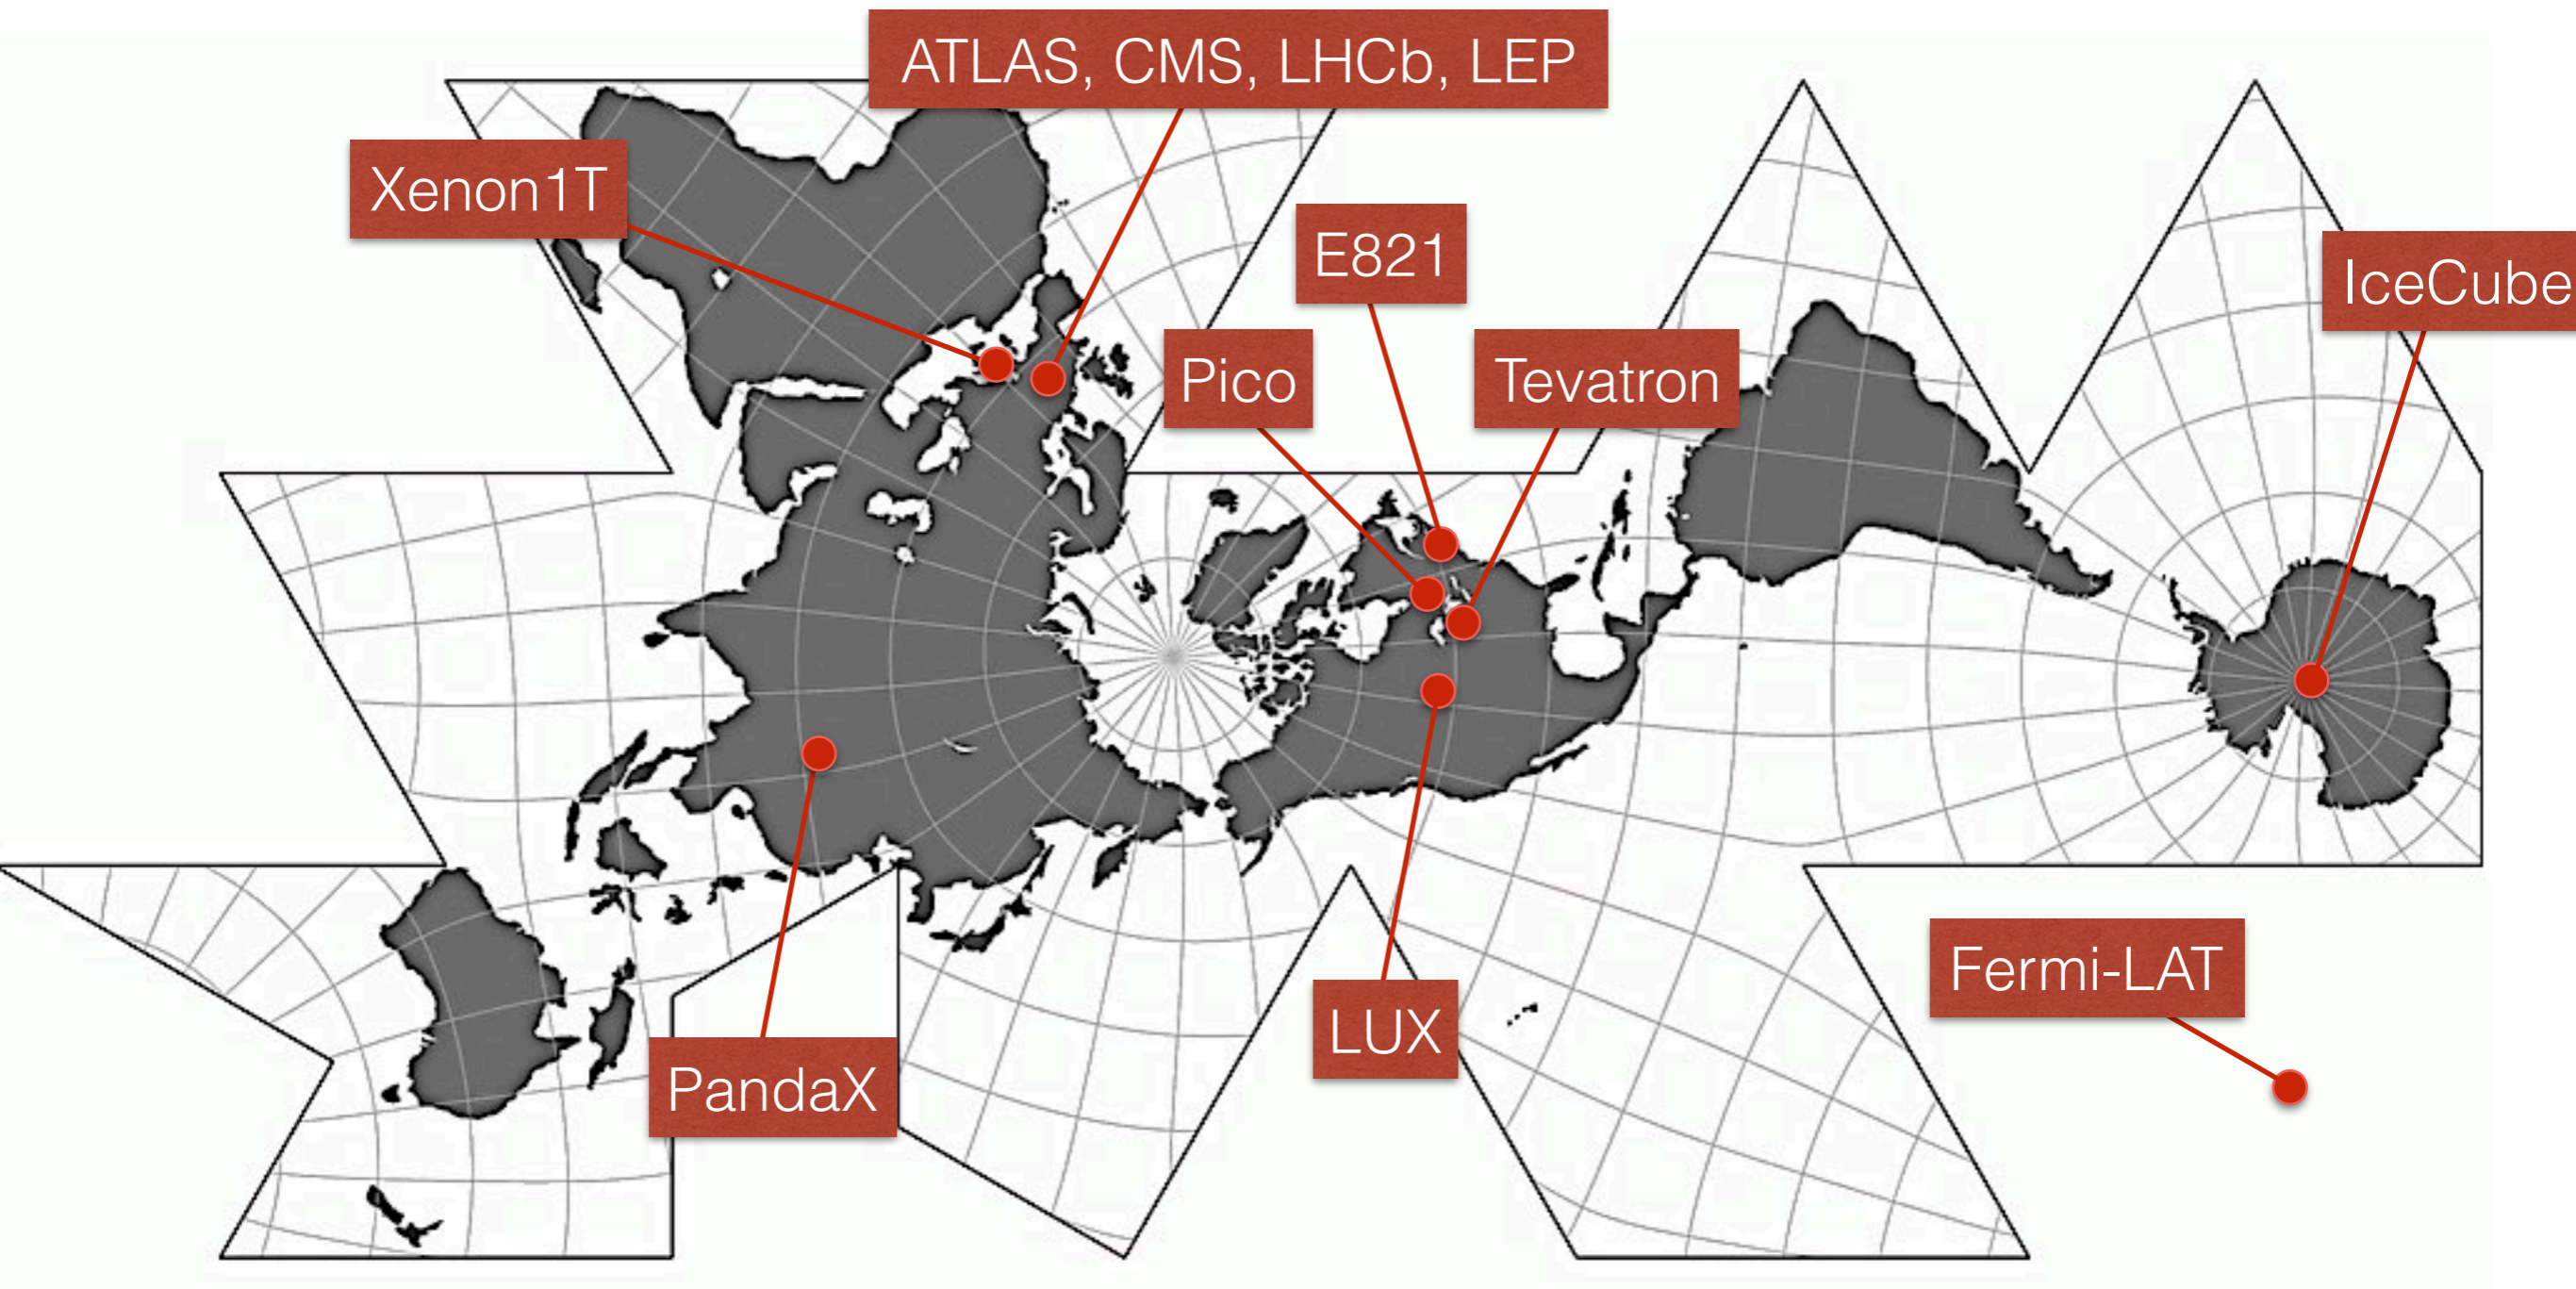

How do we do it? [1612.06333, 1906.10706] with W. Beenakker, S. Caron
R. Peeters, R. Ruiz de Austri

1. Consider SUSY GUTs and EFTs

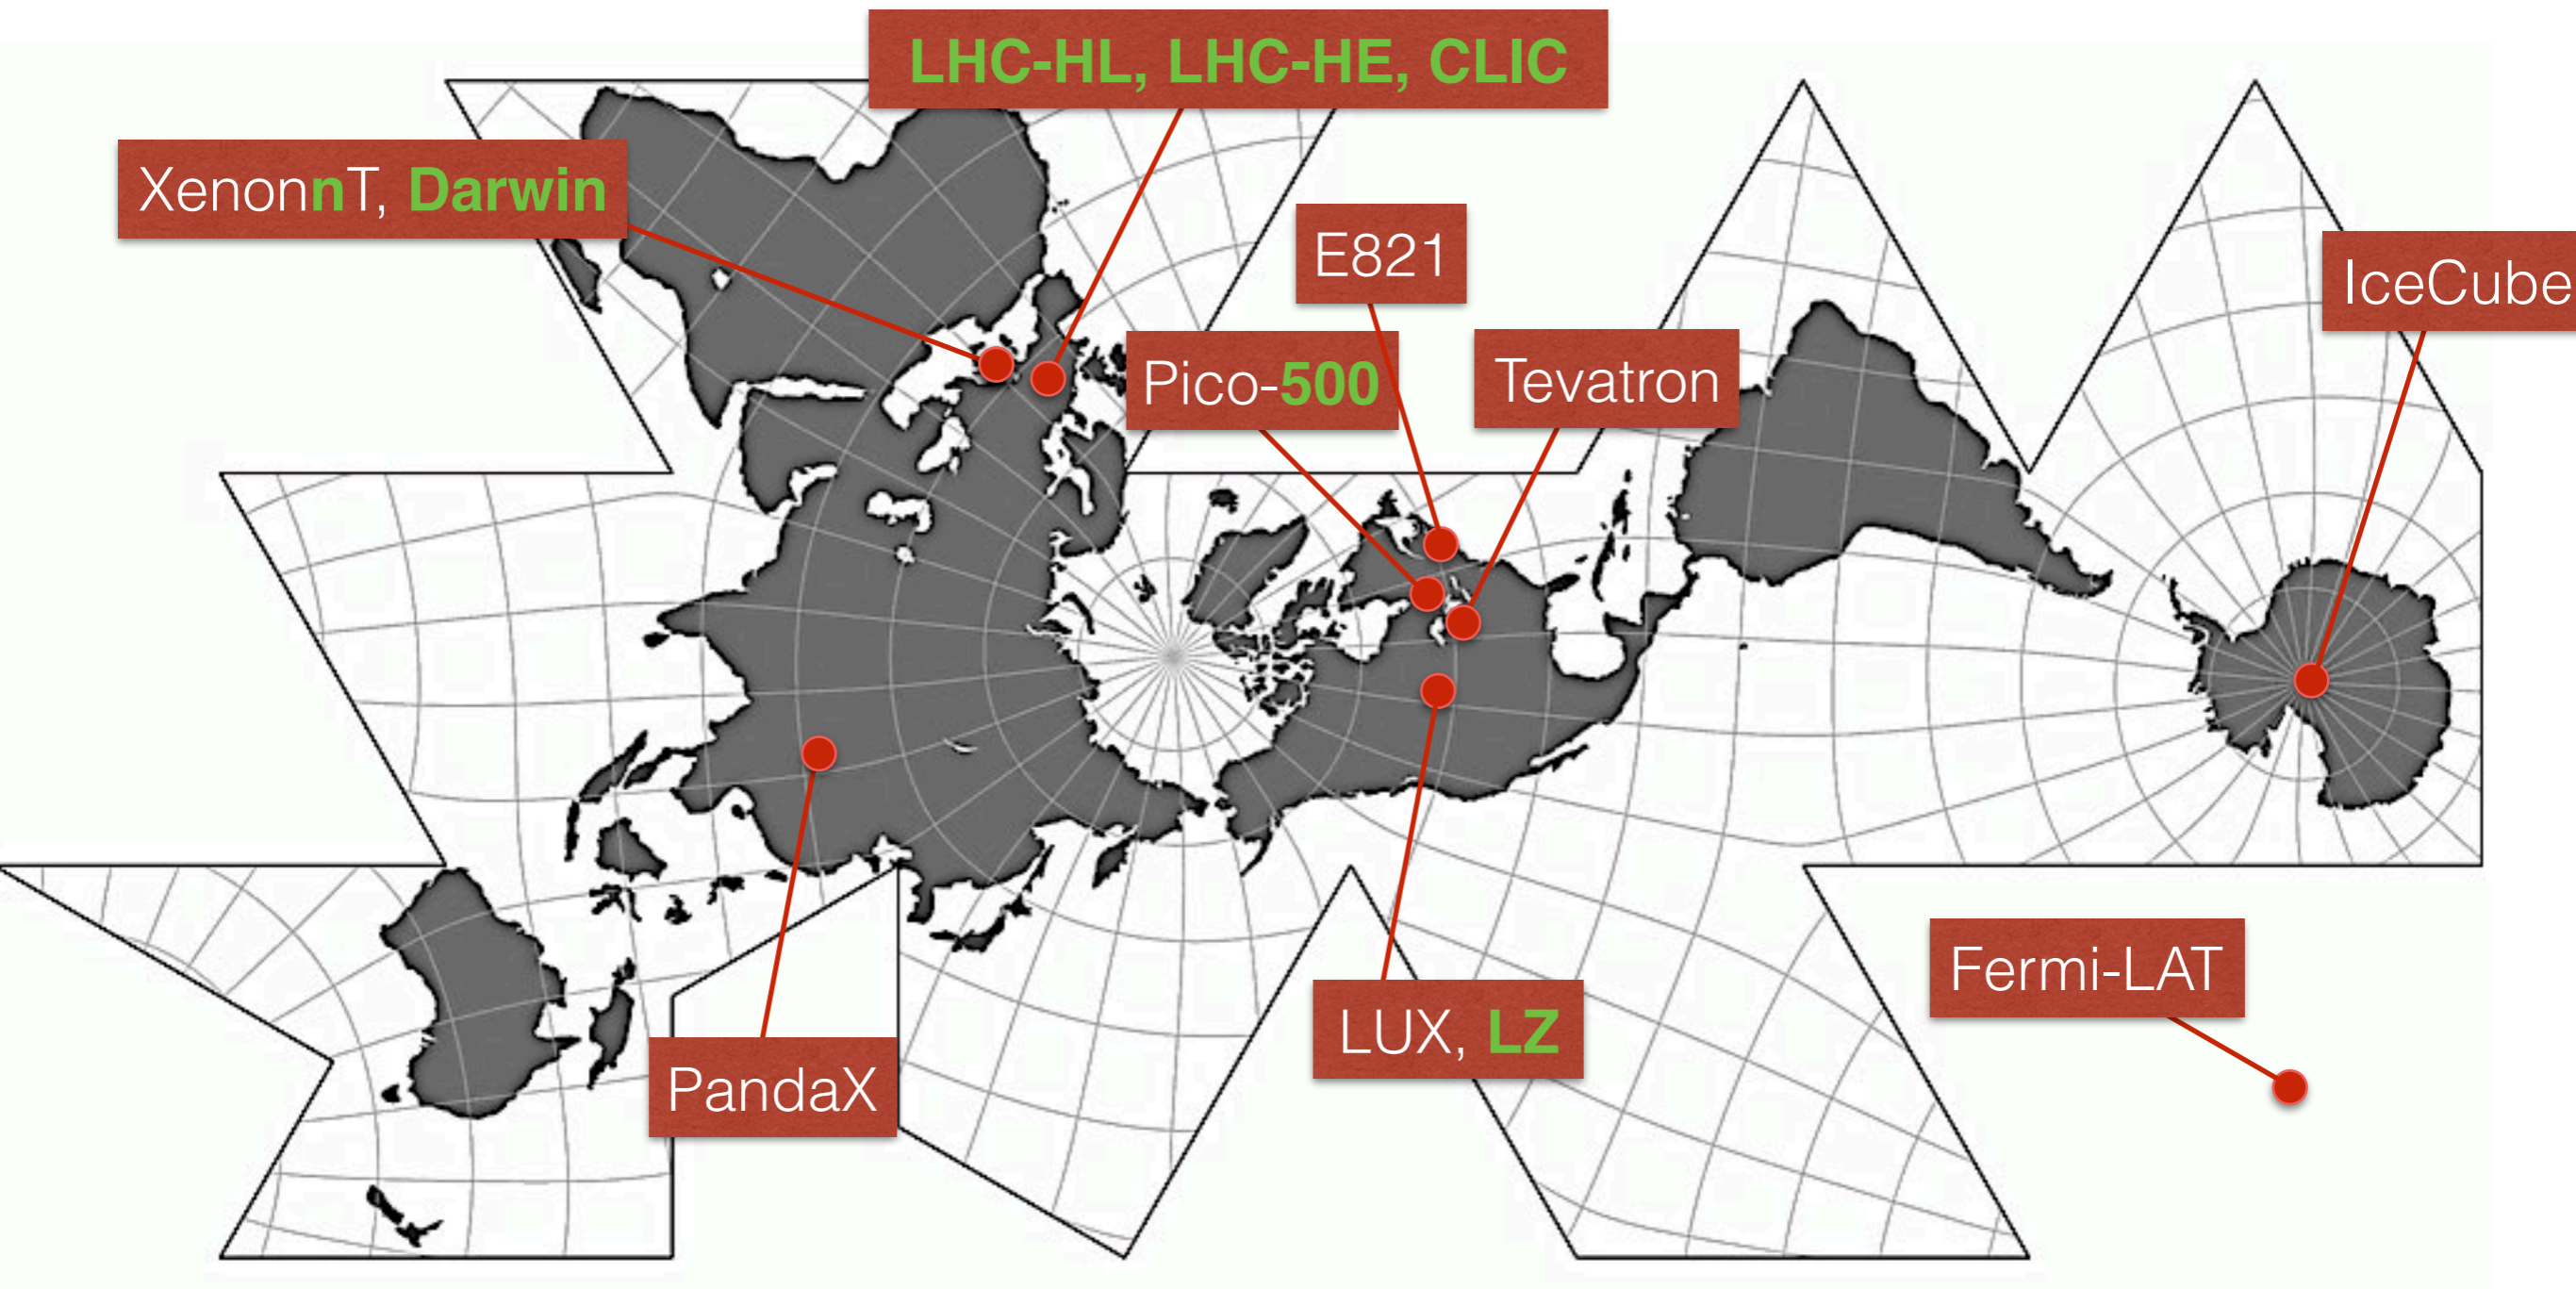

2. Combine the data

3. *Minimize* the possible amount of fine-tuning

It is important to combine data

The status of the points with the lowest FT has not changed since LEP!

Relic density vs fine-tuning

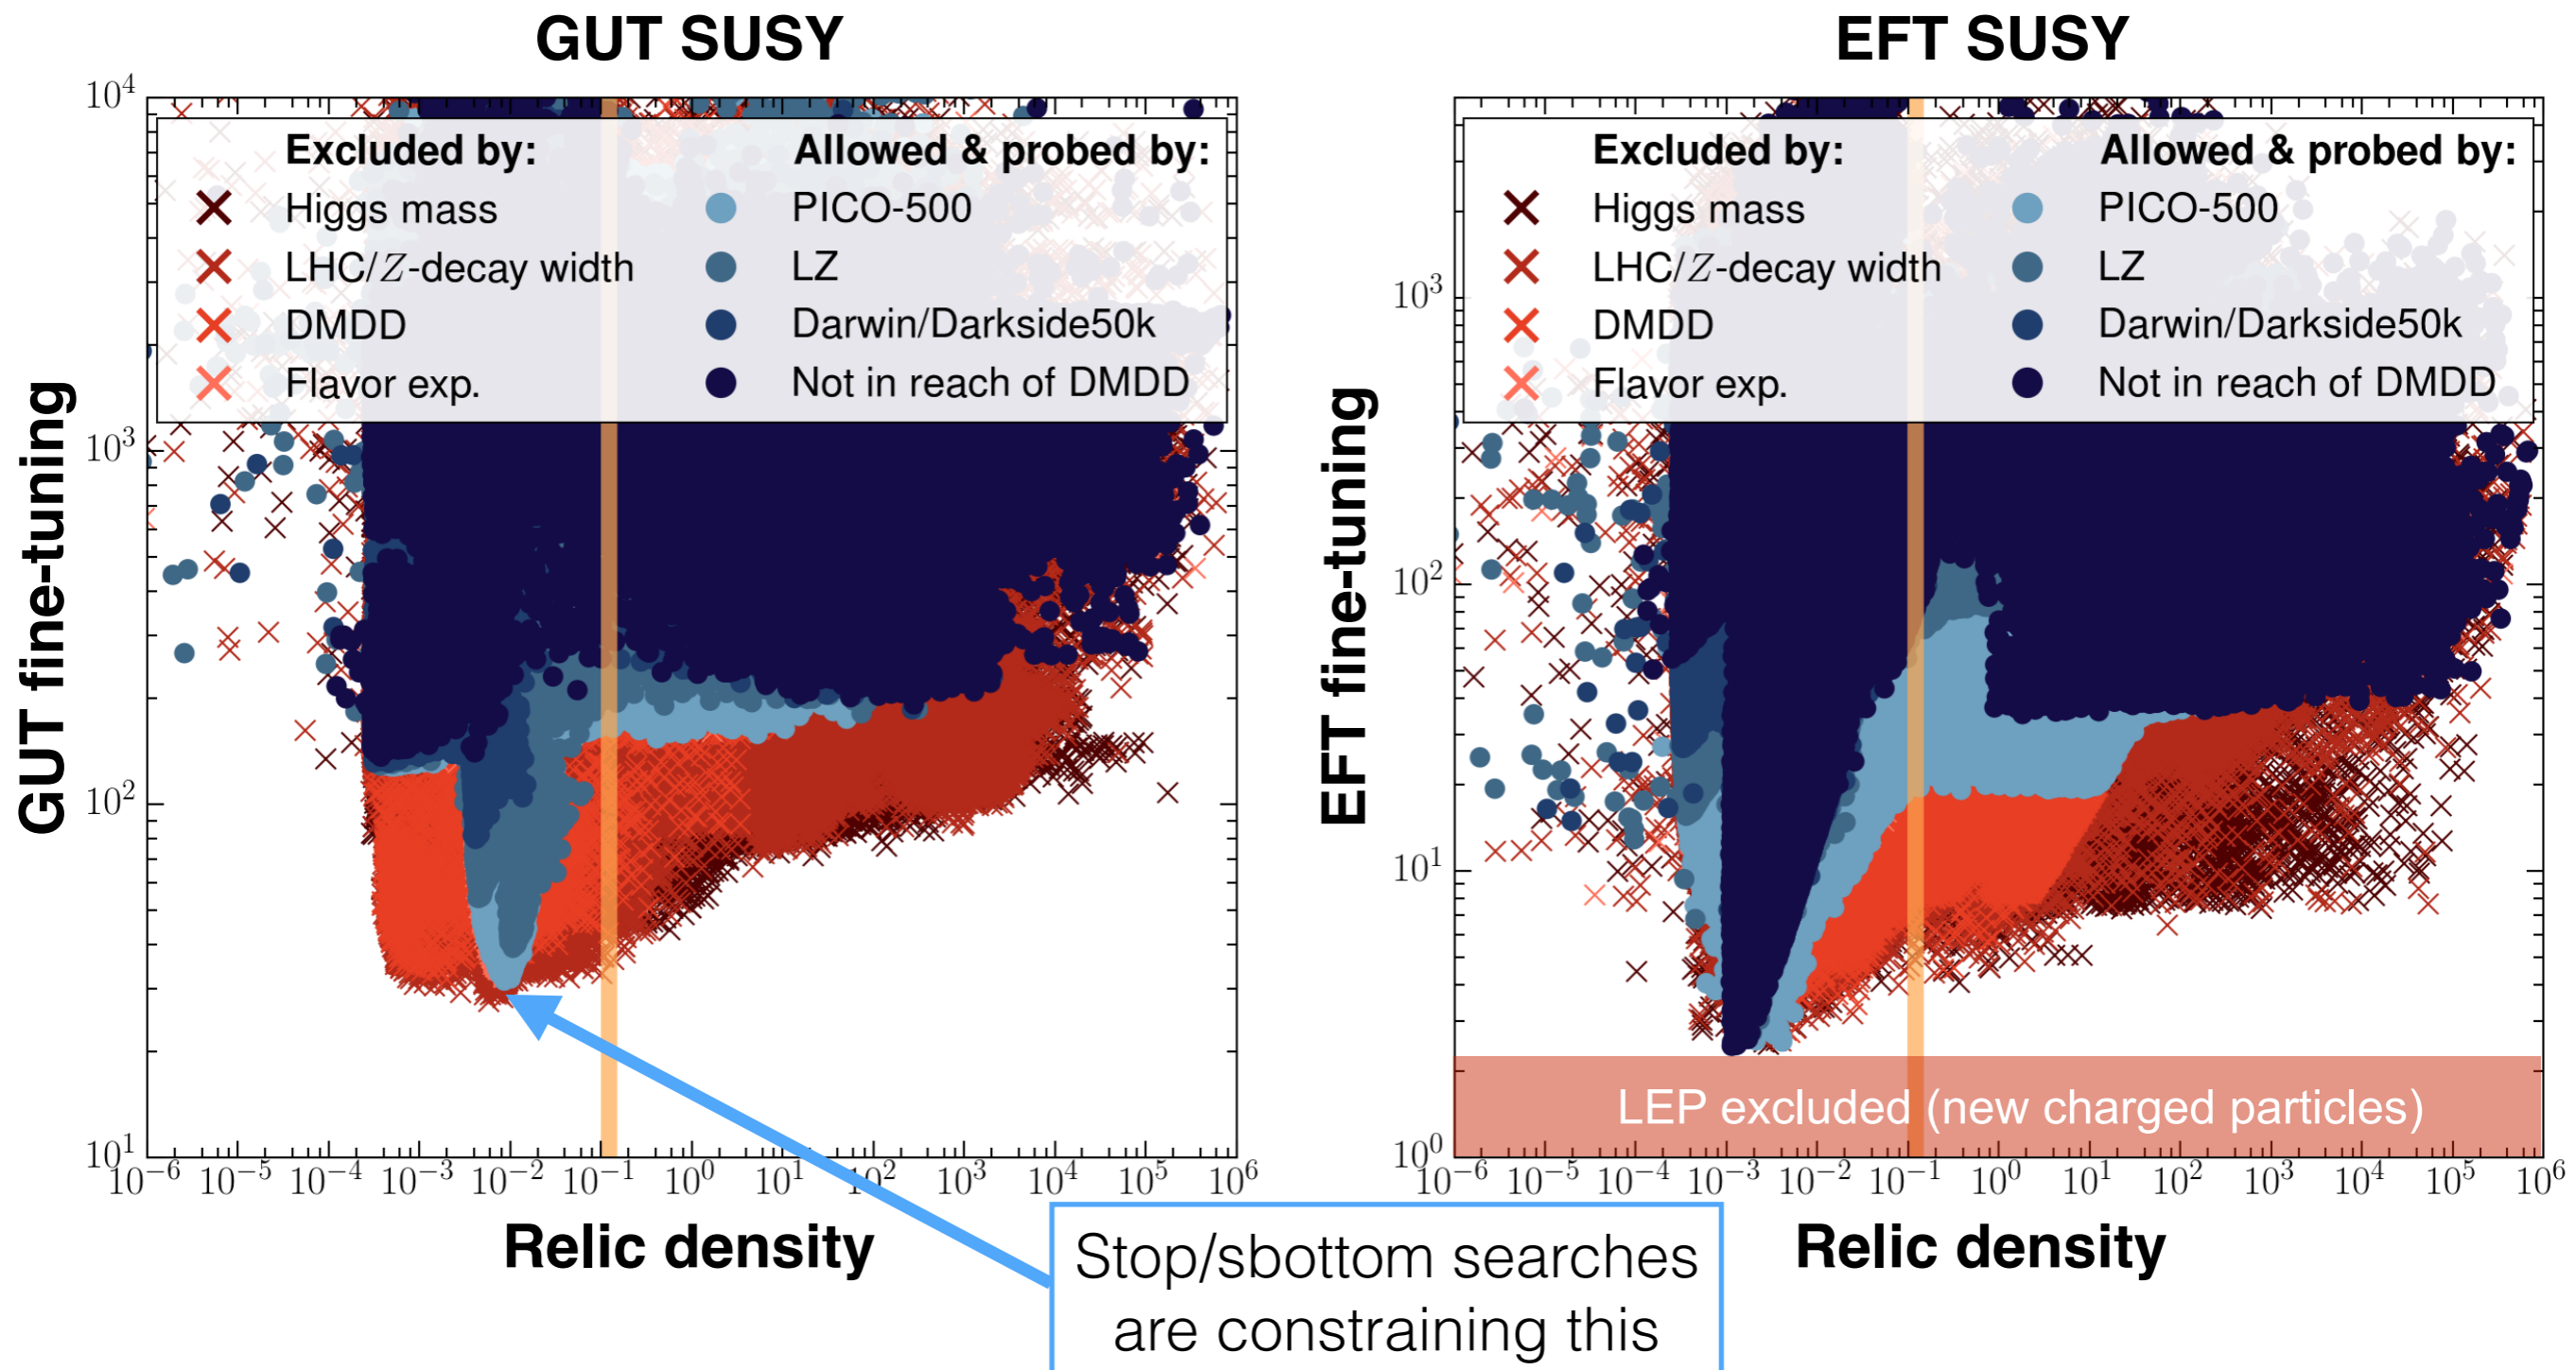

GUT SUSY

EFT SUSY

Relic density vs fine-tuning

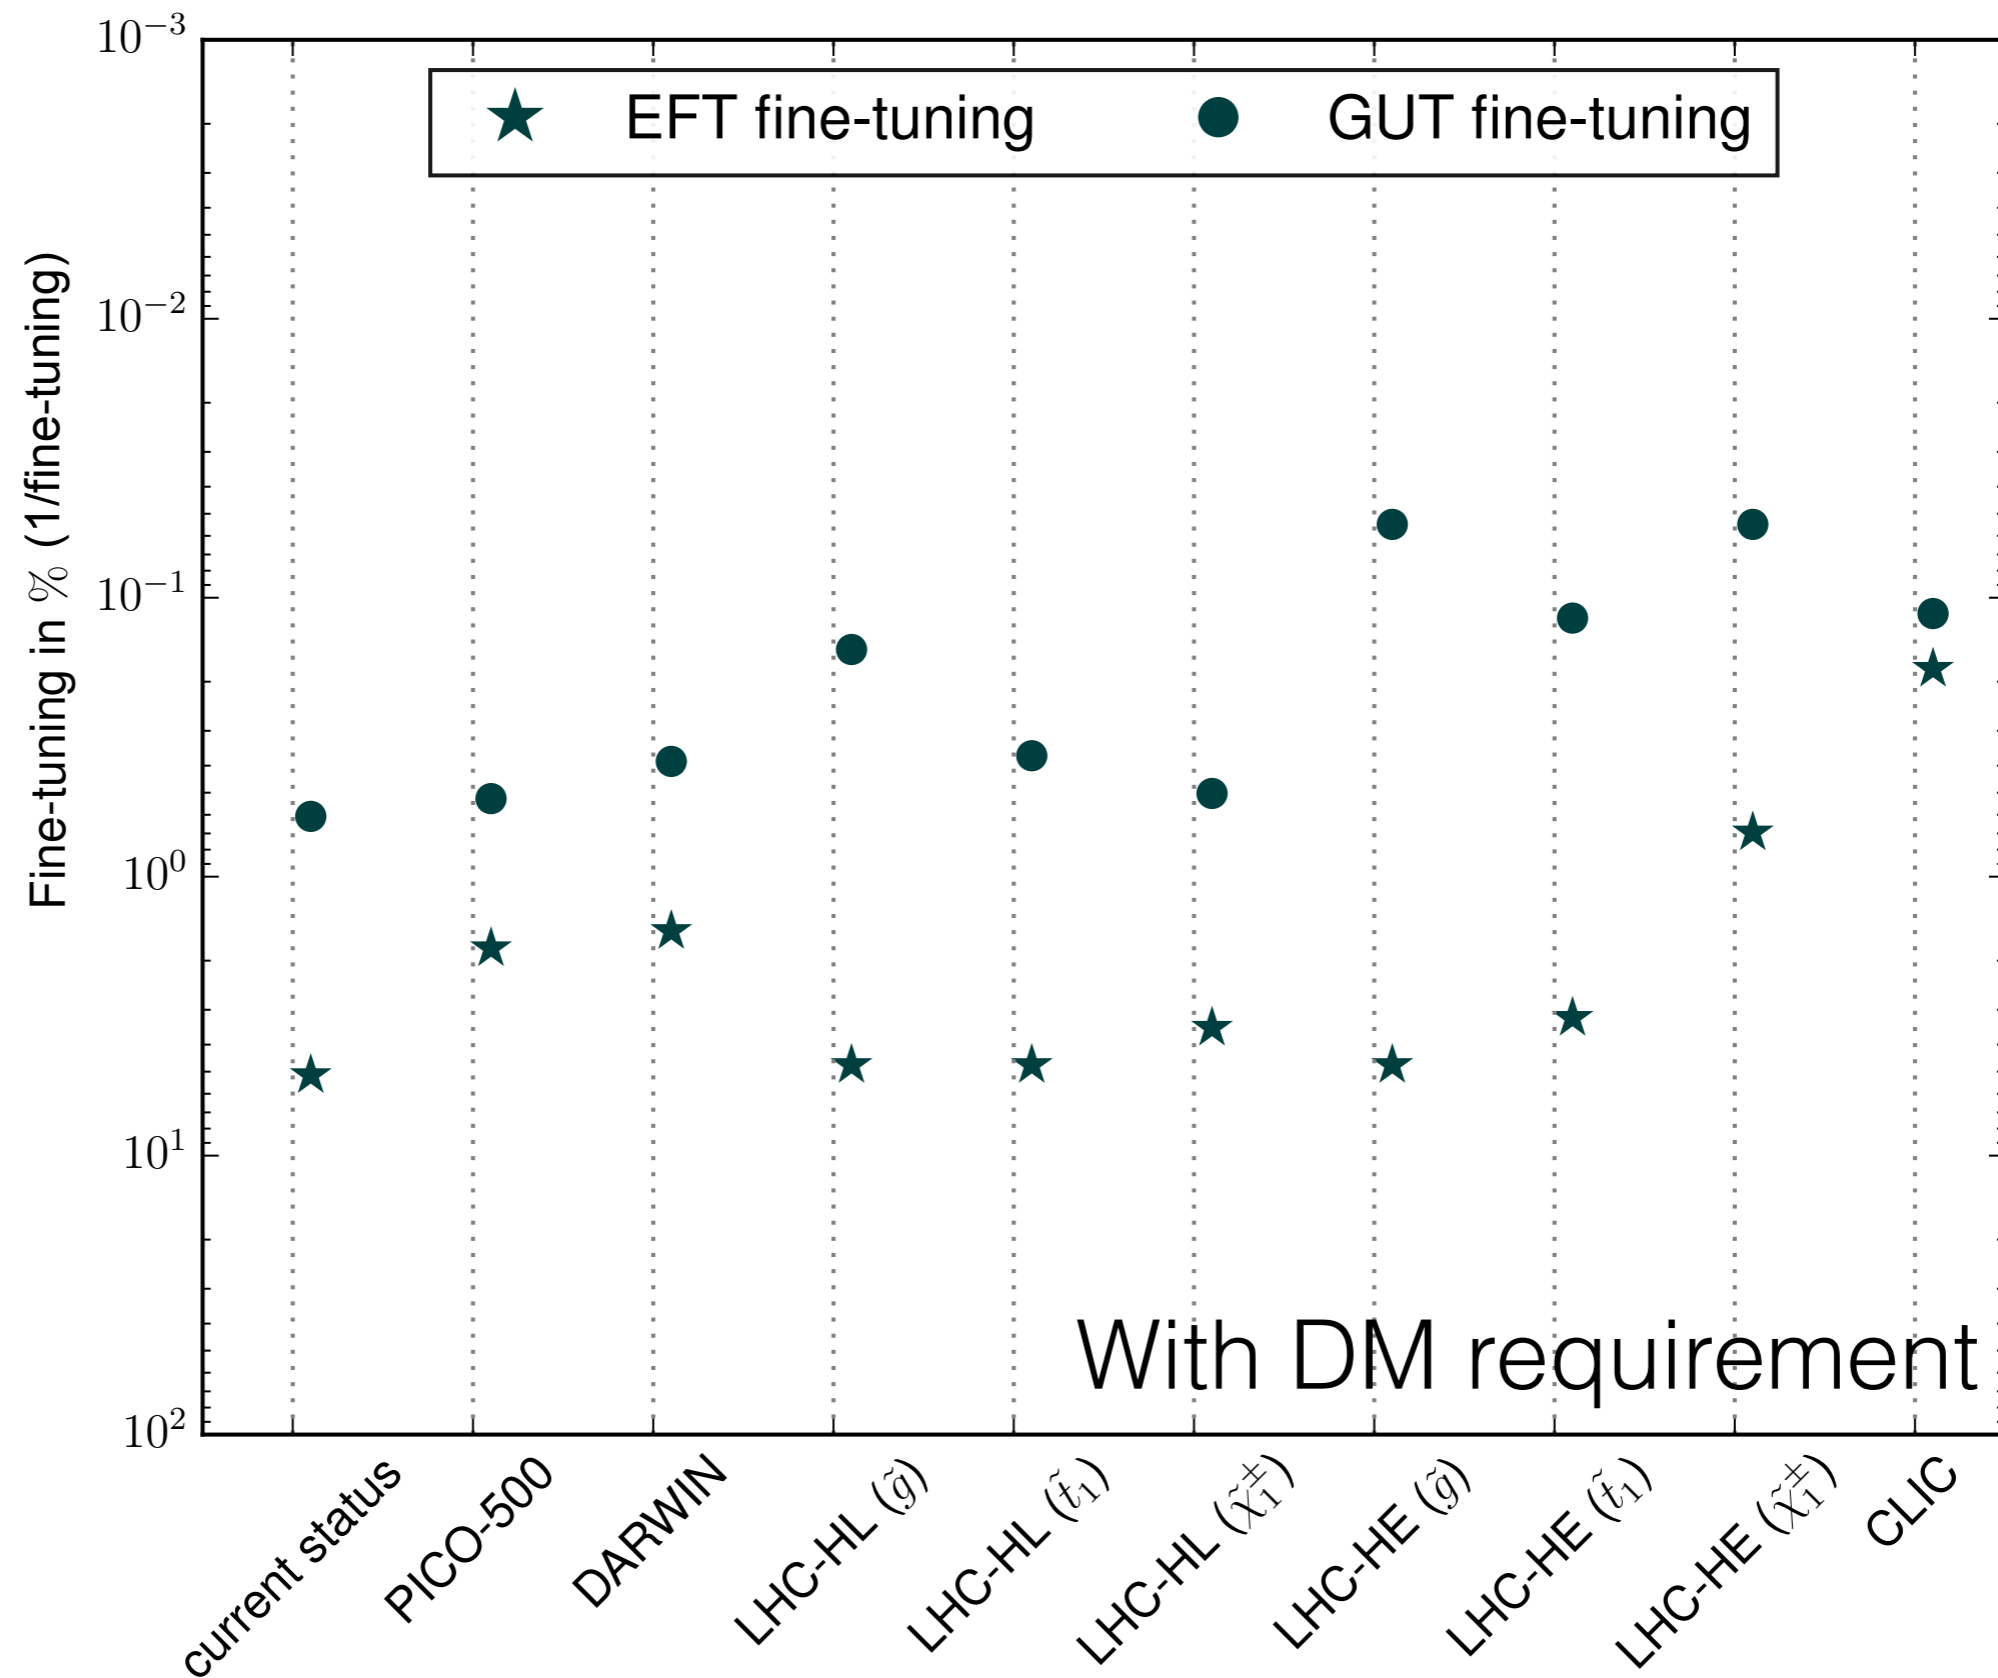

Conclusions

- The increased ATLAS/CMS limits on SUSY are no reason to worry
- Light SUSY is alive and we should not give up the chase for SUSY
- We need dedicated searches to increase coverage
- Combining data is crucial

Which future experiment to build?

The Hierarchy problem

Proton mass
1 GeV

Planck scale
 10^{19} GeV

100 GeV
W,Z, higgs mass

Why this huge energy gap?

Beta functions

- Standard model:

$$\beta_{m_H^2} = \frac{m_H^2}{16\pi^2} \left[6y_t^2 - \frac{9}{4}g^2 - \frac{3}{4}g'^2 - 6\lambda \right]$$

- No issue! The beta function is proportional with the bare higgs mass!

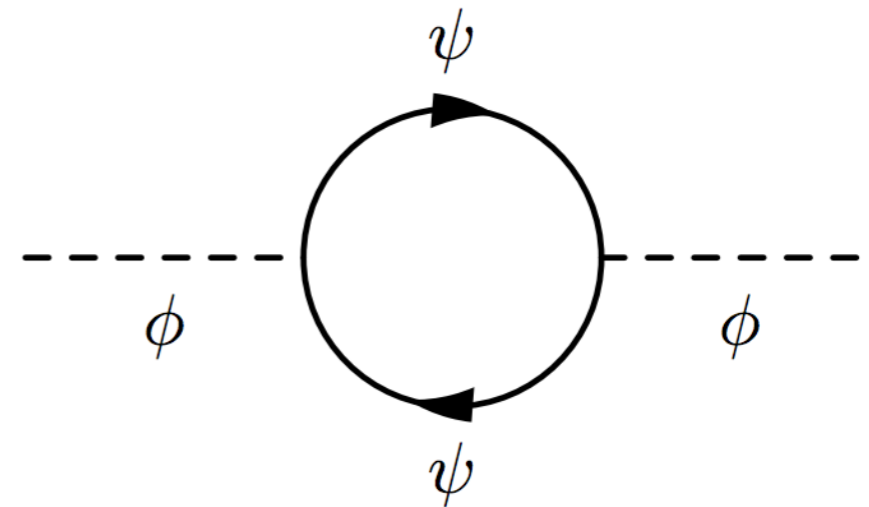

$$\delta m_H^2 \sim \frac{6y_t^2}{16\pi^2} m_H^2 \log(\mu_1/\mu_2)$$

Fine-tuning, the real story

- Pick scalar coupled to fermion

$$\mathcal{L} = -\frac{1}{2}\phi(\square + m^2)\phi + \lambda\phi\bar{\psi}\psi + \bar{\psi}(i\not{\partial} - M)\psi$$

- Compute self energy diagram

$$i\Sigma_2(p^2) \stackrel{\text{(squared missing)}}{=} -4\lambda \int \frac{d^4k}{(2\pi)^4} \int_0^1 dx \left[\frac{1}{k^2 - \Delta} + \frac{2\Delta}{[k^2 - \Delta]^2} \right]$$

$$\Delta = M^2 - p^2x(1-x)$$

Regulating the integral

- Cut off regulator:

$$\Sigma_2(p^2) = \frac{3\lambda^2}{4\pi^2} \int_0^1 dx \left([M^2 - p^2 x(1-x)] \log \left(\frac{M^2 - p^2 x(1-x)}{\Lambda^2} \right) + \Lambda^2 \right) + \text{finite}$$

- Dim reg:

$$\Sigma_2(p^2) = \frac{3\lambda^2}{4\pi^2} \left(-\frac{2M^2}{\varepsilon} + \frac{p^2}{3\varepsilon} + \int_0^1 dx \left([M^2 - p^2 x(1-x)] \log \left(\frac{M^2 - p^2 x(1-x)}{4\pi\mu^2 e^{-\Gamma_E}} \right) \right) \right)$$

EW fine-tuning

$$\frac{M_Z^2}{2} = \frac{m_{H_d}^2 + \Sigma_d^d - (m_{H_u}^2 + \Sigma_u^u) \tan^2 \beta}{\tan^2 \beta - 1} - \mu^2$$

$$\Delta_{\text{EW}} \equiv \max_i \left| \frac{C_i}{M_Z^2/2} \right|$$

$$C_{m_{H_d}} = \frac{m_{H_d}^2}{\tan^2 \beta - 1}, \quad C_{m_{H_u}} = \frac{-m_{H_u}^2 \tan^2 \beta}{\tan^2 \beta - 1}, \quad C_\mu = -\mu^2,$$
$$C_{\Sigma_d^d} = \frac{\max(\Sigma_d^d)}{\tan^2 \beta - 1}, \quad C_{\Sigma_u^u} = \frac{-\max(\Sigma_u^u) \tan^2 \beta}{\tan^2 \beta - 1}.$$

BG fine-tuning

$$\frac{M_Z^2}{2} = \frac{m_{H_d}^2 + \Sigma_d^d - (m_{H_u}^2 + \Sigma_u^u) \tan^2 \beta}{\tan^2 \beta - 1} - \mu^2$$

$$\Delta_{\text{BG}} \equiv \max |\Delta_p|$$

$$\Delta_p \equiv \frac{\partial \ln M_Z^2}{\partial \ln p_i}$$

p_i is one of the independent input parameters of the SUSY model.

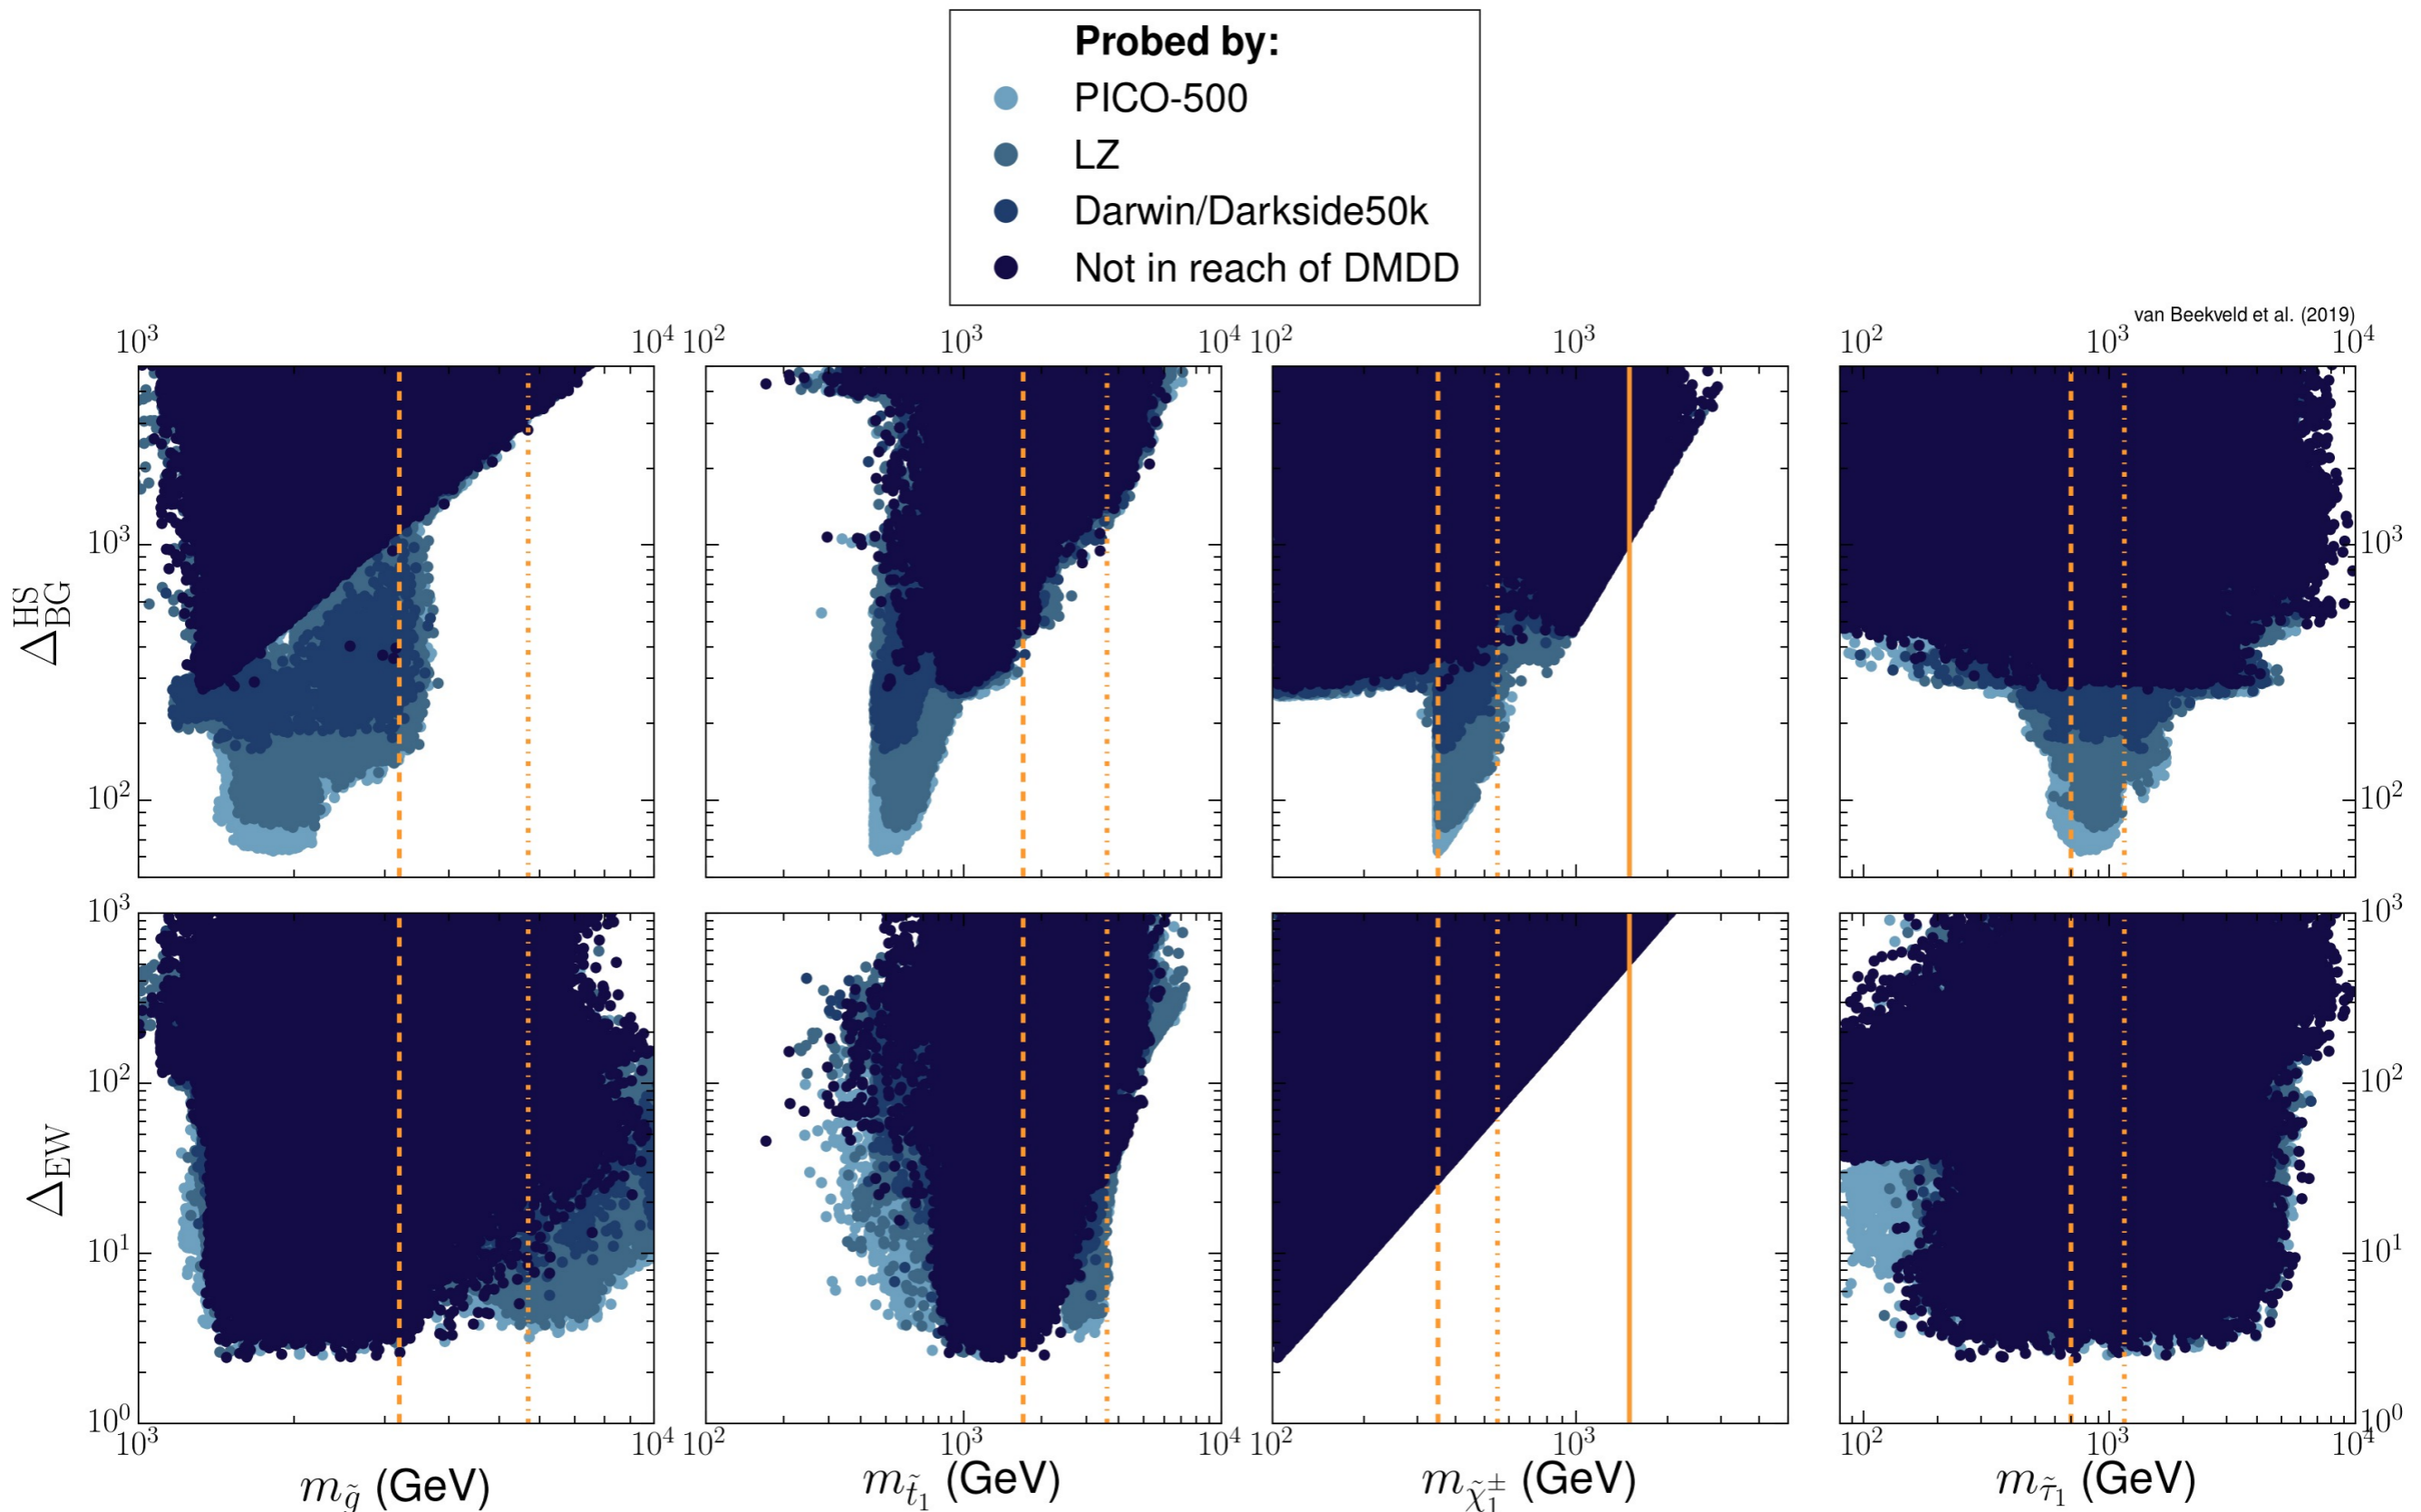

Requirements

- LEP limits on the masses of the chargino ($m_{\tilde{\chi}_1^\pm} > 103.5$ GeV) and light sleptons ($m_{\tilde{l}} > 90$ GeV) [127]. For the staus we use a limit of $m_{\tilde{\tau}} > 85$ GeV. We do not save any spectra that have sparticle masses below these limits.
- Constraints on the invisible and total width of the Z -boson ($\Gamma_{Z,\text{inv}} = 499.0 \pm 1.5$ MeV and $\Gamma_Z = 2.4952 \pm 0.0023$ GeV) [128].
- The lightest Higgs boson is required to be in the mass range of $122 \text{ GeV} \leq m_{h_0} \leq 128$ GeV.
- Taking into account the fact that the SM prediction lies well outside the experimentally obtained value with a discrepancy of $\Delta(g-2)_\mu = (24.9 \pm 6.3) \times 10^{-10}$ [129], we allow for spectra that predict $\Delta(g-2)_\mu < 40 \times 10^{-10}$.
- Measurements of the B/D -meson branching fractions $\text{Br}(B_s^0 \rightarrow \mu^+ \mu^-)$ [130], $\text{Br}(\bar{B} \rightarrow X_s \gamma)$ [131, 132], $\text{Br}(B^+ \rightarrow \tau^+ \nu_\tau)$ [133], $\text{Br}(D_s^+ \rightarrow \mu^+ \nu_\mu)$ [134] and $\text{Br}(D_s^+ \rightarrow \tau^+ \nu_\tau)$ [135].

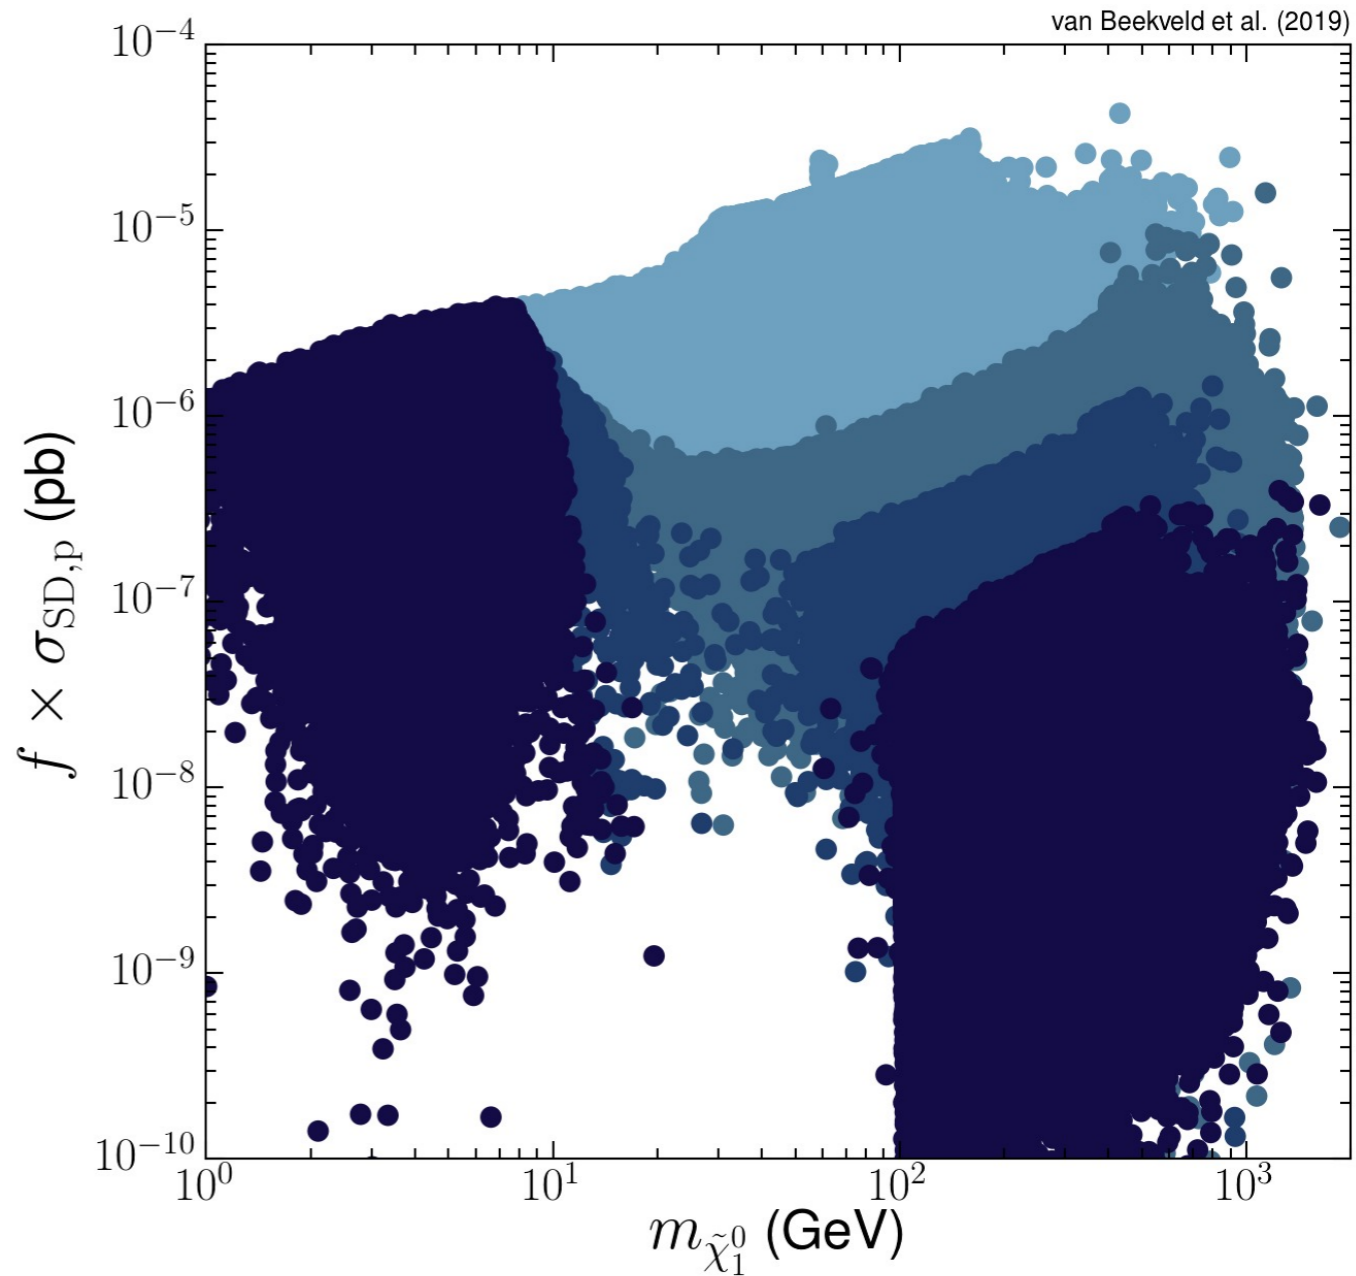

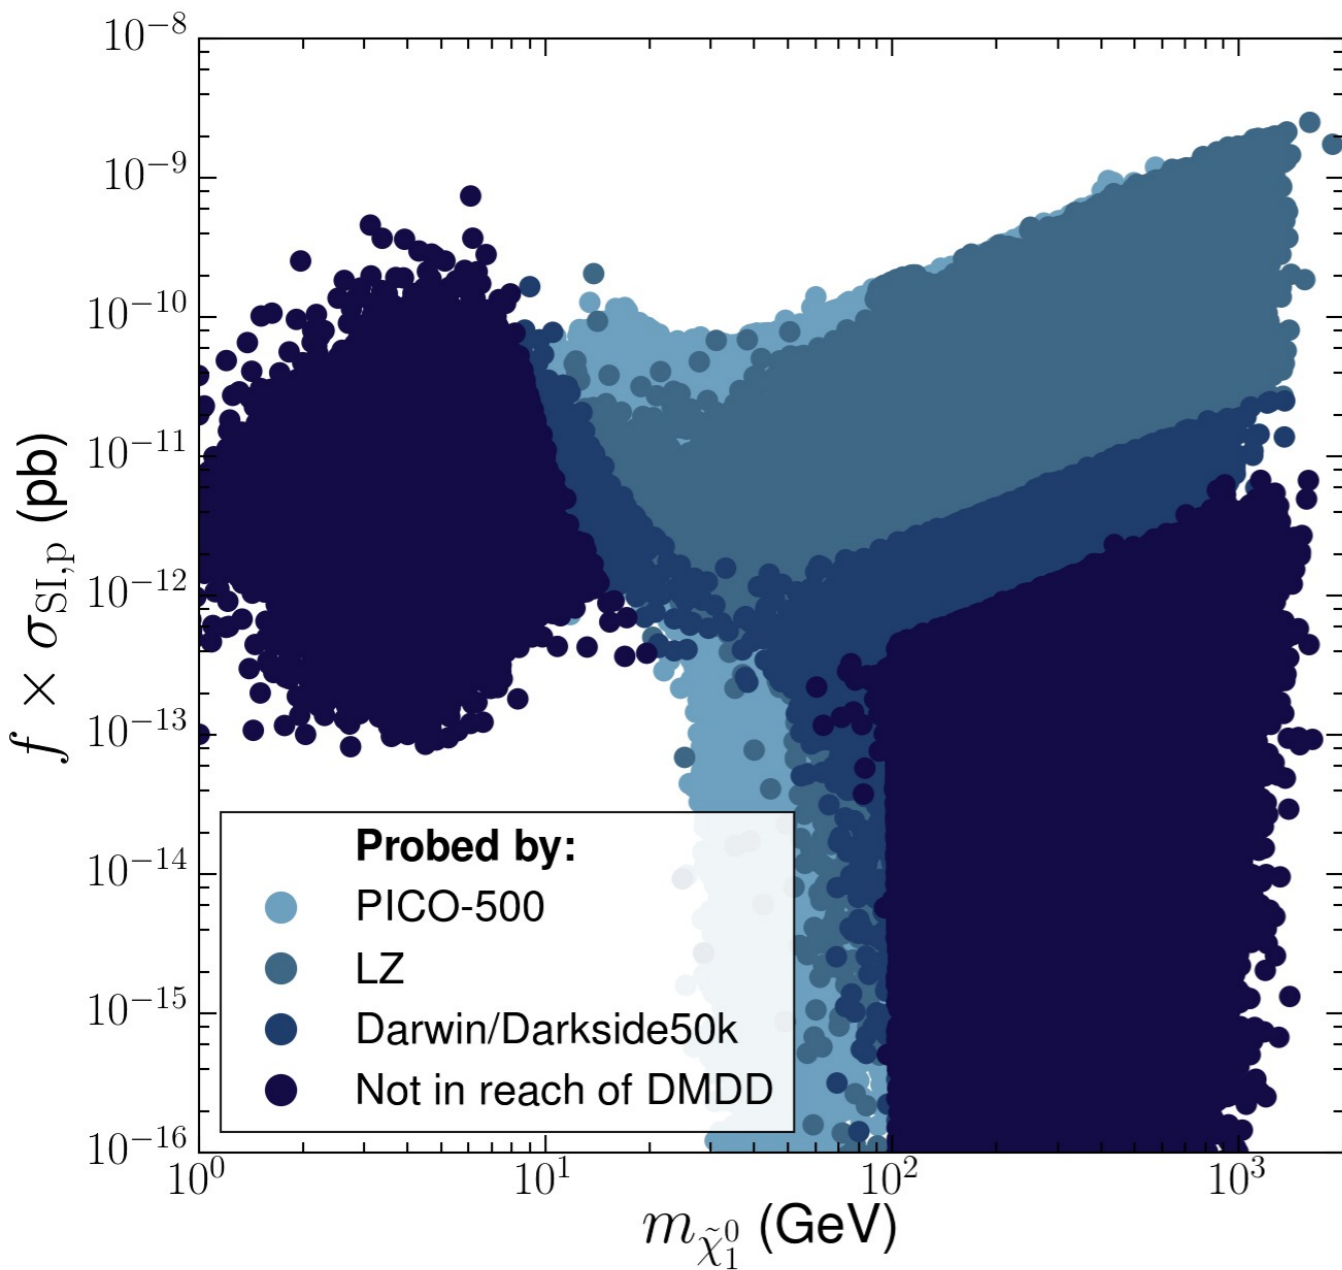

Future collider experiments

Particle	Mass cut (HL-LHC)	Mass cut (HE-LHC)	Mass cut (CLIC)
\tilde{g}	3.2 TeV	5.7 TeV	-
\tilde{t}_1	1.7 TeV	3.6 TeV	-
$\tilde{\chi}_1^\pm$ (higgsino)	350 GeV	550 GeV	1.5 TeV
$\tilde{\tau}_1$	730 GeV	1.15 TeV	-
