GIM mechanism in $K^0 \rightarrow \mu\mu$

Weak Interactions with Lepton-Hadron Symmetry*

S. L. GLASHOW, J. ILIPOULOS, AND L. MAIANI†
Lyman Laboratory of Physics, Harvard University, Cambridge, Massachusetts 02139
 (Received 5 March 1970)

We propose a model of weak interactions in which the currents are constructed out of four basic quark fields and interact with a charged massive vector boson. We show, to all orders in perturbation theory, that the leading divergences do not violate any strong-interaction symmetry and the next to the leading divergences respect all observed weak-interaction selection rules. The model features a remarkable symmetry between leptons and quarks. The extension of our model to a complete Yang-Mills theory is discussed.

splitting, beginning at order $G(G\Lambda^2)$, as well as contributions to such unobserved decay modes as $K_2 \rightarrow \mu^+ + \mu^-$, $K^+ \rightarrow \pi^+ + l + \bar{l}$, etc., involving neutral lepton

We wish to propose a simple model in which the divergences are properly ordered. Our model is founded in a quark model, but one involving **four, not three,** fundamental fermions; the weak interactions are medi-

new quantum number C for charm.

Precise flavour measurements

- Depending on your model, sensitive to multi-TeV scales, eg:

$$\mu_{B_s \rightarrow \mu^+ \mu^-} \simeq 1 \pm \frac{4\pi}{g^2 |V_{tb}^* V_{ts}|^2} \frac{v^2}{\Lambda^2}$$

$\mu_{B \rightarrow \mu\mu}$ is ratio $\text{BR}^{\text{exp}}/\text{BR}^{\text{SM}}$

$$\Lambda \gtrsim \frac{v}{\sqrt{0.2}} \times \begin{cases} \frac{\sqrt{4\pi}}{g |V_{tb}^* V_{ts}|} \\ 1 \end{cases} \simeq \begin{cases} 50 \text{ TeV}, & \text{anarchic tree} \\ 0.6 \text{ TeV}, & \text{MFV loop} \end{cases}$$

New measurement on $|V_{cb}|$

arXiv:2003.08453

- Measure decay rate of $B_s^0 \rightarrow D_s^{*-} \mu^+ \nu$
 - Depends on momentum transfer q^2 :

$$\begin{pmatrix} |V_{ud}| & |V_{us}| & |V_{ub}| e^{-i\gamma} \\ -|V_{cd}| & |V_{cs}| & |V_{cb}| \\ |V_{td}| e^{-i\beta} & -|V_{ts}| e^{i\beta_s} & |V_{tb}| \end{pmatrix}$$

$$\frac{d\Gamma(B_s^0 \rightarrow D_s^{*-} \mu^+ \nu_\mu)}{dq^2} = \frac{G_F^2 |V_{cb}|^2 |\eta_{EW}|^2 |\vec{p}| q^2}{96 \pi^3 m_{B_s}^2} \left(1 - \frac{m_\mu^2}{q^2}\right)^2$$

$$\times \left[(|H_+|^2 + |H_-|^2 + |H_0|^2) \left(1 + \frac{m_\mu^2}{2q^2}\right) + \frac{3}{2} \frac{m_\mu^2}{q^2} |H_t|^2 \right]$$

➤ Determine $|V_{cb}|$ and form factors

New measurement on $|V_{cb}|$

arXiv:2001.03225

- Measure rate relative to known B^0 decay rate from B-factories:

$$R^* \equiv \frac{BR(B_s^0 \rightarrow D_s^{*-} \mu^+ \nu)}{BR(B^0 \rightarrow D^{*-} \mu^+ \nu)} \sim \frac{|V_{cb}|^2}{BR_{\text{measured B-factories}}}$$

- Result depends on the assumed form factor parametrization:

$$|V_{cb}|_{\text{CLN}} = (41.4 \pm 0.6 (\text{stat}) \pm 0.9 (\text{syst}) \pm 1.2 (\text{ext})) \times 10^{-3}$$

$$|V_{cb}|_{\text{BGL}} = (42.3 \pm 0.8 (\text{stat}) \pm 0.9 (\text{syst}) \pm 1.2 (\text{ext})) \times 10^{-3}$$

- Conclusions:

- First measurement of V_{cb} with pp
- First measurement using B_s^0
- Parametrisation is not responsible for inclusive vs exclusive disagreements
- Result in agreement with the exclusive *and* inclusive averages

Flavour anomalies

- A remark on consistency

INTERNATIONAL JOURNAL OF HIGH-ENERGY PHYSICS

CERN COURIER

VOLUME 55 NUMBER 9 NOVEMBER 2015

Tensions in the Standard Model

Flavour anomalies? A reminder

- What are the (anomalous) measurements?
 - FCNC: $b \rightarrow sll$
 - LFNU: $b \rightarrow sll$ and $b \rightarrow clv$

FCNC: $b \rightarrow sll$

- $b \rightarrow s$ transition forbidden at tree level in SM

FCNC: $b \rightarrow s l l$

- $b \rightarrow s$ transition occurs at loop level
 - Suppressed in SM
 - NP can compete with SM

Flavour-Changing-Neutral-Current-
Electro-Weak-Penguin diagram

FCNC: $b \rightarrow sll$

- $b \rightarrow s$ transition occurs at loop level
 - Suppressed in SM
 - NP can compete with SM

The first penguin:

THE PHENOMENOLOGY OF THE NEXT LEFT-HANDED QUARKS

J. Ellis, M.K. Gaillard ^{*)}, D.V. Nanopoulos ^{†)} and S. Rudaz ^{‡)}
CERN - Geneva

FCNC: $b \rightarrow sll$

- $b \rightarrow s$ transition occurs at loop level
 - LQ quite fashionable these days

deVolkskrant

Moeder aller deeltjes: de zoektocht naar de leptoquark

Is het fundamenteelste deeltje in het universum altijd over het hoofd gezien? Komende week kan de wereld opgeschud worden, als natuurkundigen in Seoul hun resultaten bekendmaken. Leptoquark, onthoud dat woord.

Martijn van Calmthout 29 juni 2018, 11:25

$R_K: B^+ \rightarrow K^+ \mu^+ \mu^-$ and $B^+ \rightarrow K^+ e^+ e^-$

- Similar loop diagram!
- Measure ratio μ/e
- SM expectation: $R_K=1$

$$R_K = \frac{\Gamma(B^+ \rightarrow K^+ \mu^+ \mu^-)}{\Gamma(B^+ \rightarrow K^+ e^+ e^-)}$$

$R_K: B^+ \rightarrow K^+ \mu^+ \mu^- / B^+ \rightarrow K^+ e^+ e^-$

Old result

- Similar loop diagram!
- Measure ratio μ/e
- SM expectation: $R_K=1$

$$R_K = \frac{\Gamma(B^+ \rightarrow K^+ \mu^+ \mu^-)}{\Gamma(B^+ \rightarrow K^+ e^+ e^-)}$$

$$R_K = 0.745^{+0.090}_{-0.074}(\text{stat}) \pm 0.036(\text{syst})$$

LHCb, PRL 113 (2014) 151601

➤ **Lepton flavour
"non-universal" ?**

- Similar loop diagram!
- Measure ratio μ/e
- SM expectation: $R_K=1$

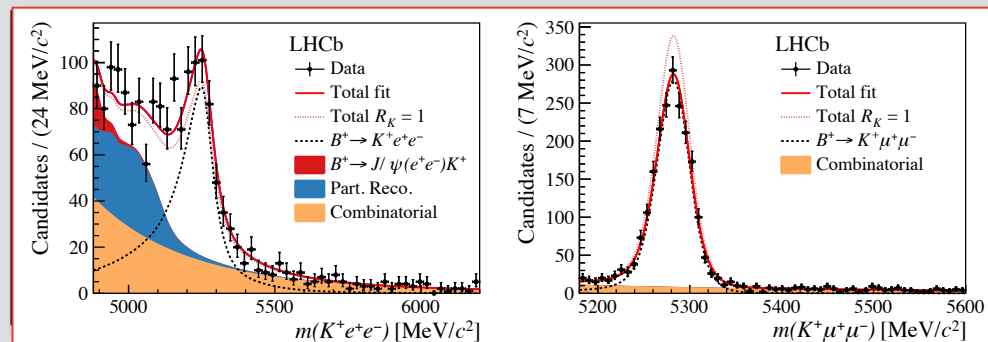

$$R_K = \frac{\Gamma(B^+ \rightarrow K^+ \mu^+ \mu^-)}{\Gamma(B^+ \rightarrow K^+ e^+ e^-)}$$

$$R_K = 0.846^{+0.060}_{-0.054} + 0.016_{-0.014}$$

➤ **Lepton flavour
"non-universal" ?**

LHCb, PRL 122 (2019) 191801

$R_{K^*}: B^0 \rightarrow K^{0*} \mu^+ \mu^-$ and $B^0 \rightarrow K^{0*} e^+ e^-$

- Similar loop diagram!
- Measure ratio μ/e
- SM expectation: $R_{K^*}=1$
- Extra bin at low q^2 ...
 - $q^2 \sim 0$ not helicity suppressed
 - But dominated by photon pole
 - EM coupling to photon undebated...!!

$$R_{K^{*0}} = \begin{cases} 0.66 \pm_{-0.07}^{+0.11} (\text{stat}) \pm 0.03 (\text{syst}) & \text{for } 0.045 < q^2 < 1.1 \text{ GeV}^2/c^4 \\ 0.69 \pm_{-0.07}^{+0.11} (\text{stat}) \pm 0.05 (\text{syst}) & \text{for } 1.1 < q^2 < 6.0 \text{ GeV}^2/c^4 \end{cases}$$

LHCb Coll., JHEP 1708 (2017) 055

- **Lepton flavour**
"non-universal" ?

$R_{pK}: \Lambda_b^0 \rightarrow p K \mu^+ \mu^- / \Lambda_b^0 \rightarrow K^{0*} e^+ e^-$

arXiv:1912.08139

- Similar loop diagram!
- Measure ratio μ/e
- SM expectation: $R_{pK}=1$

$$R_{pK}|_{0.1 < q^2 < 6 \text{ GeV}^2/c^4} = 0.86_{-0.11}^{+0.14} \pm 0.05$$

➤ **Lepton flavour
“non-universal” ?**

More LFNU? Semileptonic decays: $b \rightarrow c l \nu$

μ^+/τ^+

■ $B^0 \rightarrow D^{(*)} l \nu$ Measured ratio τ/μ

- Multiple experiments:
- Multiple c-modes:
- Multiple tau final states:
- Multiple tags:

Belle, BaBar, LHCb
 $D, D^*, J/\psi$
 $\mu, 1\text{-prong}, 3\text{-prong}$
semileptonic, hadronic

and with B_c^+ :

$$\mathcal{R}(J/\psi) = 0.71 \pm 0.17 (\text{stat}) \pm 0.18 (\text{syst})$$

More LFNU? Semileptonic decays: $b \rightarrow c l \nu$

$$\mu^+ / \tau^+$$

- Discrepancy in 2D about 3σ

Decay rates: $b \rightarrow sll$

- Study **same** process with **different** hadrons:

Decay rates: $b \rightarrow sll$

- Decay rate is consistently low:

$$B^0 \rightarrow K^{0*} \mu^+ \mu^- : P_5'$$

Old result

- Similar loop diagram!
- More observables
 - Invariant mass of $\mu\mu$ -pair
 - Angles of K and μ

- A remark on consistency

Intermezzo: Effective couplings

- Historical example

$$\frac{G_F}{\sqrt{2}} = \frac{g^2}{8M_W^2}$$

- Both are correct, depending on the energy scale you consider

Intermezzo: Effective couplings

- Historical example

- Analog: Flavour-changing neutral current

Intermezzo: Effective couplings

- Effective coupling can be of various “kinds”

- Vector coupling
- Axial coupling
- Left-handed coupling (V-A)
- Right-handed (to quarks)
- ...

$$\mathcal{H}_{\text{eff}} = \frac{G_F}{\sqrt{2}} V_{\text{CKM}} \sum_i C_i(\mu) Q_i$$

- Analog: Flavour-changing neutral current

Intermezzo: Effective couplings

■ Effective coupling can be of various “kinds”

- Vector coupling: C_9
- Axial coupling: C_{10}
- Left-handed coupling (V-A): C_9 - C_{10}
- Right-handed (to quarks): C_9', C_{10}', \dots
- Many more! $C_7, C_{1,2}, \dots$

$$\mathcal{H}_{\text{eff}} = \frac{G_F}{\sqrt{2}} V_{\text{CKM}} \sum_i C_i(\mu) Q_i$$

See e.g. Buras & Fleischer, [hep-ph/9704376](https://arxiv.org/abs/hep-ph/9704376)

Semi-Leptonic Operators (fig. 11f):

$$Q_{9V} = (\bar{s}b)_{V-A}(\bar{\mu}\mu)_V$$

$$Q_{10A} = (\bar{s}b)_{V-A}(\bar{\mu}\mu)_A$$

• Analog: Flavour-changing neutral current

Intermezzo: Effective couplings

Model independent fits:

- C_9^{NP} deviates from 0 by $>4\sigma$
- Independent fits by many groups favour:
 - $C_9^{\text{NP}} = -1$ or
 - $C_9^{\text{NP}} = -C_{10}^{\text{NP}}$

➤ All measurements (175) agree with a single (simple?) shift...

LHCb, JHEP 02 (2016) 104

$$\Delta\text{Re}(\mathcal{C}_9) = -1.04 \pm 0.25$$

Intermezzo: Effective couplings

Model independent fits:

- C_9^{NP} deviates from 0 by $>4\sigma$

 &\quad \left. S_8 \sin 2\theta_K \sin 2\theta_{\ell} \sin \phi + S_9 \sin^2 \theta_K \sin^2 \theta_{\ell} \sin 2\phi \right]
 \end{aligned}$$

Best fit

- Improved fit for $C_9^{\text{NP}} = -1.0$

Emerging patterns of New Physics with and without Lepton Flavour Universal contributions

Marcel Algueró^{a,b}, Bernat Capdevila^{a,b,c}, Andreas Crivellin^{d,e}, Sébastien Descotes-Genon^f, Pere Masjuan^{a,b}, Joaquim Matias^{a,b}, Martín Novoa Brunet^f and Javier Virto^g.

- There is a reduction of the internal tensions between some of the most relevant observables of the fit, in particular, between the new averages of R_K and P'_5 . This leads to an increase in consistency between the different anomalies. This is illustrated

1D Hyp.	All			
	Best fit	$1\sigma/2\sigma$	Pull _{SM}	p-value
$C_{9\mu}^{NP}$	-1.03	$[-1.19, -0.88]$ $[-1.33, -0.72]$	6.3	37.5 %
$C_{9\mu}^{NP} = -C_{10\mu}^{NP}$	-0.50	$[-0.59, -0.41]$ $[-0.69, -0.32]$	5.8	25.3 %

- The reduced uncertainties of the $B \rightarrow K^* \mu \mu$ data and its improved internal consistency sharpen statistical statements on the hypotheses considered. There is a significant increase of the statistical exclusion of the SM hypothesis as its p-value is reduced down to 1.4% (i.e. 2.5σ). The Pull_{SM} of the 6D fit is now higher (5.8σ).

arXiv:1903.09578, **addendum 6 Apr 2020**

- Similar picture as before
- Reduction of internal tensions
- Increase of statistical exclusion of SM hypothesis
 - p-value 1.4%, Pull 5.8σ

Conclusions

- Precision measurements to scrutinize the Standard Model
- Precision measurements reach very high mass scales
- Precision measurements are not yet precise enough

2019

C_{10}^{NP} vs C_9^{NP}

2030

CKM: γ , V_{ub} , Δm_s

What NP could it be?

- If interpreted as NP signals, both set of anomalies are not in contradiction among themselves & with existing low- & high-energy data.
Taken together, they point out to NP coupled mainly to 3rd generation, with a flavor structure connected to that appearing in the SM Yukawa couplings

G. Isidori, *Implications workshop*, CERN, 10 Nov 2017
<https://indico.cern.ch/event/646856/timetable/>

- Anomalous measurements:
 - FCNC: $b \rightarrow sll$
 - LFNU: $b \rightarrow sll$ and $b \rightarrow clv$
- What are the interpretations?

Model building

- Most popular models: Z' or Leptoquark

SM

$SU(2)'$

Leptoquark

Model building

Step 1: Effective theory

$$\mathcal{L}_{\text{eff}} = \mathcal{L}_{\text{SM}} - \frac{1}{v^2} \lambda_{ij}^q \lambda_{\alpha\beta}^\ell \left[C_T (\bar{Q}_L^i \gamma_\mu \sigma^a Q_L^j) (\bar{L}_L^\alpha \gamma^\mu \sigma^a L_L^\beta) + C_S (\bar{Q}_L^i \gamma_\mu Q_L^j) (\bar{L}_L^\alpha \gamma^\mu L_L^\beta) \right]$$

Observable	Experimental bound	Linearised expression
$R_{D^{(*)}}^{\tau\ell}$	1.237 ± 0.053	$1 + 2C_T(1 - \lambda_{sb}^q V_{tb}^*/V_{ts}^*)(1 - \lambda_{\mu\mu}^\ell/2)$
$\Delta C_9^\mu = -\Delta C_{10}^\mu$	-0.61 ± 0.12 [36]	$-\frac{\pi}{\alpha_{\text{em}} V_{tb} V_{ts}^*} \lambda_{\mu\mu}^\ell \lambda_{sb}^q (C_T + C_S)$
$R_{b \rightarrow c}^{\mu e} - 1$	0.00 ± 0.02	$2C_T(1 - \lambda_{sb}^q V_{tb}^*/V_{ts}^*) \lambda_{\mu\mu}^\ell$
$B_{K^{(*)}\nu\bar{\nu}}$	0.0 ± 2.6	$1 + \frac{2}{3} \frac{\pi}{\alpha_{\text{em}} V_{tb} V_{ts}^*} C_S^{\text{SM}} (C_T - C_S) \lambda_{sb}^q (1 + \lambda_{\mu\mu}^\ell)$
$\delta g_{\tau_L}^Z$	-0.0002 ± 0.0006	$0.033C_T - 0.043C_S$
$\delta g_{\nu_\tau}^Z$	-0.0040 ± 0.0021	$-0.033C_T - 0.043C_S$
$ g_\tau^W/g_\ell^W $	1.00097 ± 0.00098	$1 - 0.084C_T$
$\mathcal{B}(\tau \rightarrow 3\mu)$	$(0.0 \pm 0.6) \times 10^{-8}$	$2.5 \times 10^{-4} (C_S - C_T)^2 (\lambda_{\tau\mu}^\ell)^2$

Step 2: Simplified models

$SU(2)_L$ -singlet vector leptoquark, $U_1^\mu \equiv (\mathbf{3}, \mathbf{1}, 2/3)$

$$\begin{aligned} \mathcal{L}_U &= -\frac{1}{2} U_{1,\mu\nu}^\dagger U^{1,\mu\nu} + M_U^2 U_{1,\mu}^\dagger U_1^\mu + g_U (J_U^\mu U_{1,\mu} + \text{h.c.}) \\ J_U^\mu &\equiv \beta_{i\alpha} \bar{Q}_i \gamma^\mu L_\alpha \end{aligned}$$

Model building

- Many models! See e.g.:

➤ Possible BSM models

- Heavy Z' model

arXiv:1706.07808

- Other new heavy scalars/vectors also leptoquark possible
- arXiv:01509.05020, 1608.07832, 1704.05438, 1607.01659, 1704.07845, hep-ph/0610037, ...

Model building

Ingredients

- NP: large coupling $b \rightarrow c \tau \nu$
 - Large coupling to 3rd gen leptons
 - Left-handed coupling (no RH neutrino)
- NP: small (non-vanishing) coupling $b \rightarrow s \mu \mu$
 - Small coupling to 2nd gen leptons
 - Left-handed coupling (from C_9)

Model building

Ingredients

- NP: large coupling $b \rightarrow c \tau \nu$
 - Large coupling to 3rd gen leptons
 - Left-handed coupling (no RH neutrino)
- NP: small (non-vanishing) coupling $b \rightarrow s \mu \mu$
 - Small coupling to 2nd gen leptons
 - Left-handed coupling (from C_9)

J.M.Camalich

Experimental constraints

- High p_T searches (No $\pi\pi$ resonance: no s-channel Z')
- Radiative constr. $\tau \rightarrow \mu \nu \nu$
- B_s^0 mixing (No tree level NP: small b_s implies large $\tau \nu$)
- B_c^+ lifetime (Scalar LQ increases $\text{BR}(B_c^+ \rightarrow \tau^+ \nu)$)

Vector LQ favoured
over
Scalar LQ or Z'

Model building

$SU(2)_L$ -singlet vector leptoquark

emerges as a particularly simple and successful framework.

- Many more experimental handles; predictions can be checked!

- Universal for all $b \rightarrow c \tau \nu$:
 - Accurate $R(D^*)$, $R(J/\psi)$, ...

$$\frac{R_D}{(R_D)_{SM}} = \frac{\Gamma(B \rightarrow D^* \tau \nu) / \Gamma_{SM}}{\Gamma(B \rightarrow D^* \mu \nu) / \Gamma_{SM}} = \frac{\Gamma(B_c \rightarrow \psi \tau \nu) / \Gamma_{SM}}{\Gamma(B_c \rightarrow \psi \mu \nu) / \Gamma_{SM}} = \frac{\Gamma(\Lambda_b \rightarrow \Lambda_c \tau \nu) / \Gamma_{SM}}{\Gamma(\Lambda_b \rightarrow \Lambda_c \mu \nu) / \Gamma_{SM}} = \dots$$

- Strong coupling to τ au's:
 - Measure e.g. $B^0 \rightarrow K^* \tau \tau$

- LFNU linked with LFV:
 - Look for e.g. $B^0 \rightarrow K^* \tau \mu$
 - $BR(\tau \rightarrow \mu \mu \mu) \sim 10^{-9}$

	$\mu\mu$ (ee)	$\tau\tau$	$\nu\nu$	$\tau\mu$	μe
$b \rightarrow s$	R_K, R_{K^*} $O(20\%)$	$B \rightarrow K^{(*)} \tau\tau$ $\rightarrow 100 \times SM$	$B \rightarrow K^{(*)} \nu\nu$ $O(1)$	$B \rightarrow K \tau\mu$ $\rightarrow \sim 10^{-6}$	$B \rightarrow K \mu e$???
$b \rightarrow d$	$B_d \rightarrow \mu\mu$ $B \rightarrow \pi \mu\mu$ $B_s \rightarrow K^{(*)} \mu\mu$ $O(20\%) [R_K=R_\pi]$	$B \rightarrow \pi \tau\tau$ $\rightarrow 100 \times SM$	$B \rightarrow \pi \nu\nu$ $O(1)$	$B \rightarrow \pi \tau\mu$ $\rightarrow \sim 10^{-7}$	$B \rightarrow \pi \mu e$???

- c, u symmetry:
 - Study suppressed semileptonic

$$\frac{\Gamma(B \rightarrow \pi \tau \nu) / \Gamma_{SM}}{\Gamma(B \rightarrow \pi \mu \nu) / \Gamma_{SM}} = \frac{\Gamma(\Lambda_b \rightarrow p \tau \nu) / \Gamma_{SM}}{\Gamma(\Lambda_b \rightarrow p \mu \nu) / \Gamma_{SM}} = \frac{\Gamma(B_s \rightarrow K^* \tau \nu) / \Gamma_{SM}}{\Gamma(B_s \rightarrow K^* \mu \nu) / \Gamma_{SM}} = \dots = \frac{R_D}{(R_D)_{SM}}$$

- B_s mixing
 - $O(1-10\%)$ effect on Δm_s

Model building

- Many more experimental handles; predictions can be checked!
- High p_T signatures?

– LQ pairs

– LQ t-channel in $bb \rightarrow \tau\tau$

Reachable
during HL-LHC

– Single production channel
(dominant?)

The need for more precision

Imagine if Fitch and Cronin had stopped at the 1% level, how much physics would have been missed”

– A.Soni

- “A special search at Dubna was carried out by Okonov and his group. They did not find a single $K_L^0 \rightarrow \pi^+ \pi^-$ event among 600 decays into charged particles (Anikira et al., JETP 1962). At that stage the search was terminated by the administration of the lab. The group was unlucky.”

– L.Okun

(remember: $B(K_L^0 \rightarrow \pi^+ \pi^-) \sim 2 \cdot 10^{-3}$)
