# Shower position fit on single shower files

Apply likelihood method on single shower files (elec shower,  
100 TeV)

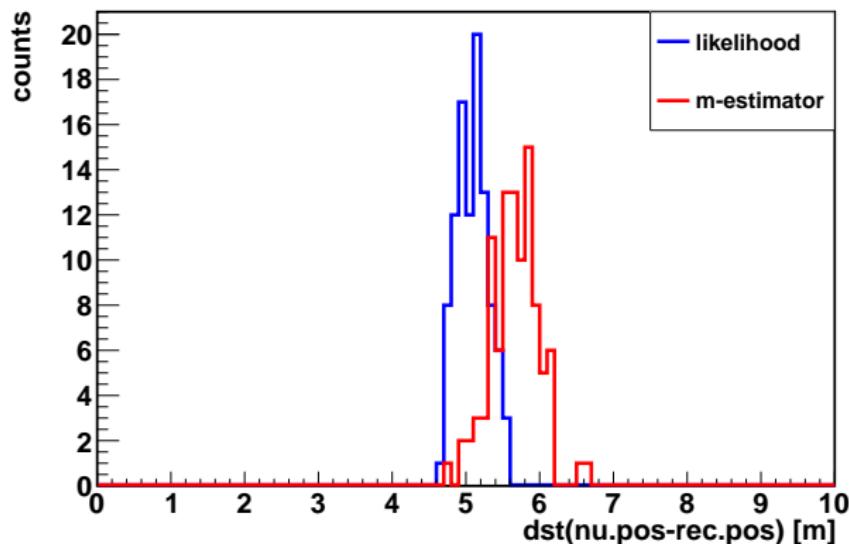

Figure : distance between simulated nu vertex and rec pos

# Shower position fit on single shower files

Apply likelihood method on single shower files (elec shower,  
100 TeV)

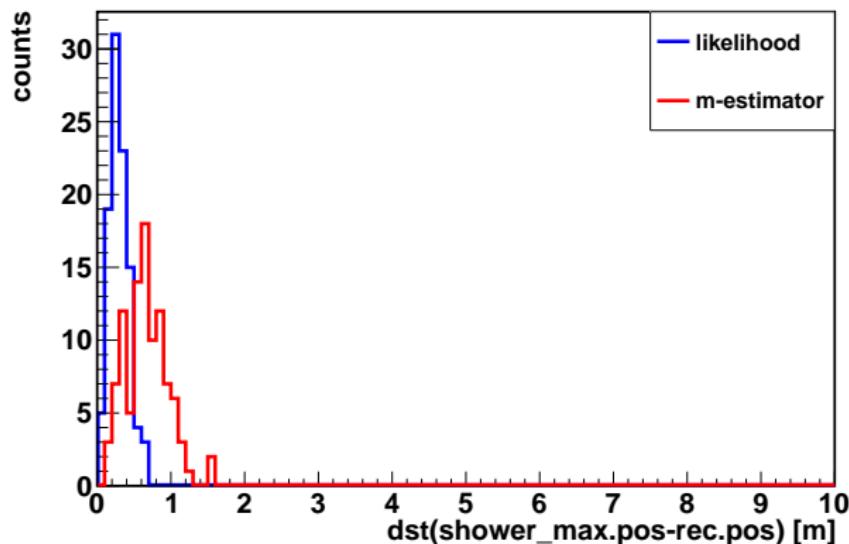

Figure : distance between calculated shower maximum and rec pos

# Shower position fit on single shower files

Apply likelihood method on single shower files (elec shower,  
100 TeV)

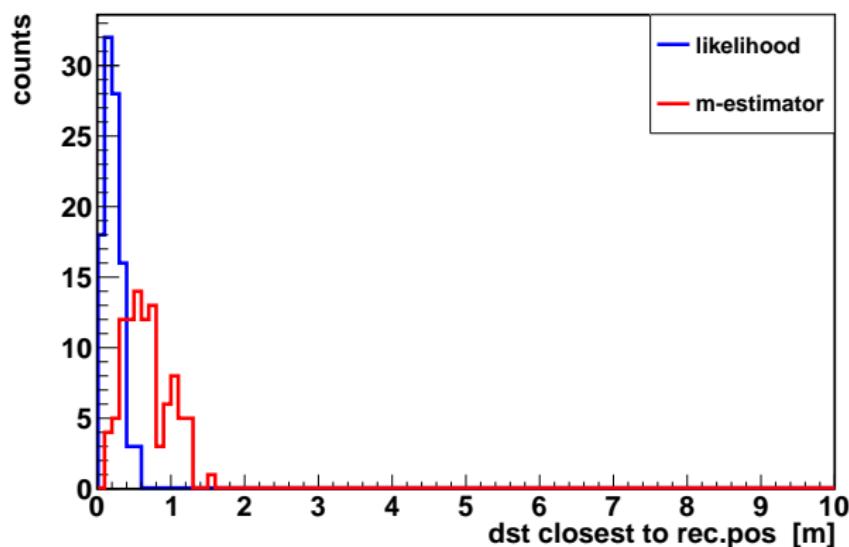

Figure : distance of closest approach to simulated original electron dir

## 2 shower position fit: Hit selection

Last time:

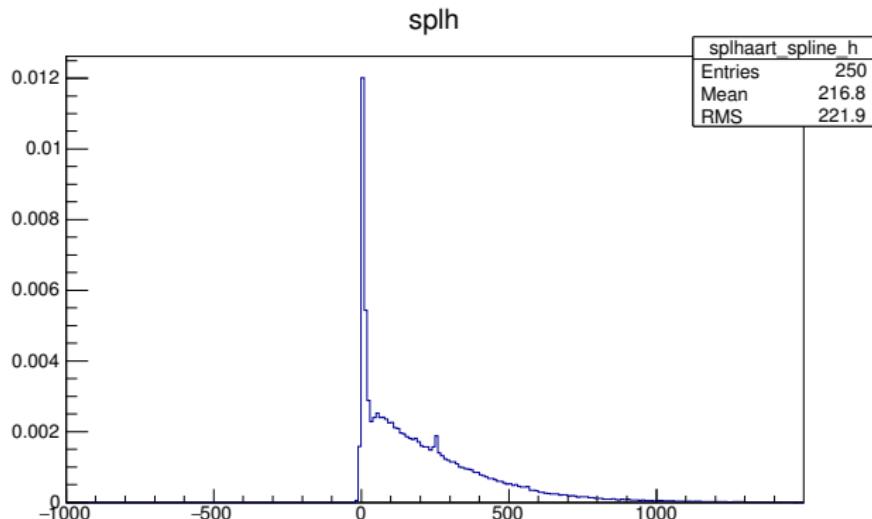

- Merge all hits on PMT within 300 ns
- Merge all hits on a DOM within 20 ns into coincidence
- take all coincidences within  $\pm 800$  ns from input shower

Now:

- Merge all hits on PMT within 300 ns
- Make a L1 selection with  $\Delta t \leq 20$  ns (only two hits per L1)
- all L1 within  $\pm 800$  ns from input shower

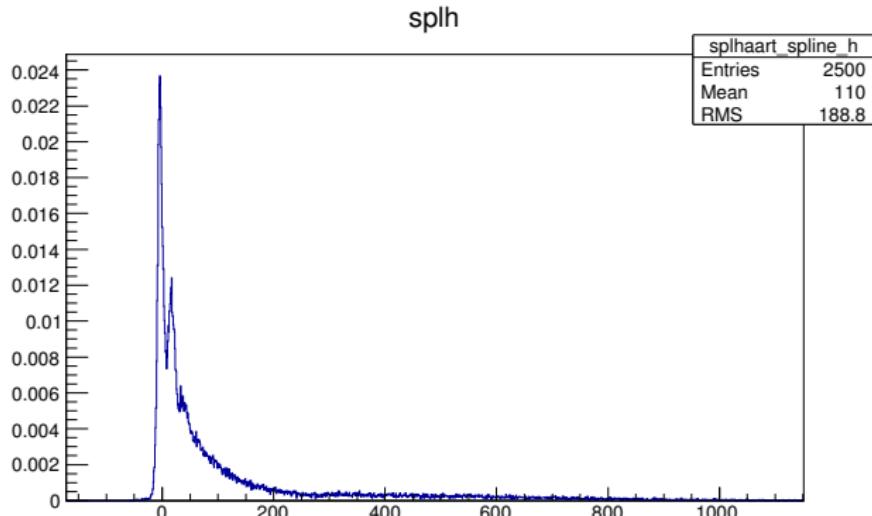

# Spline fit to residual

all hits

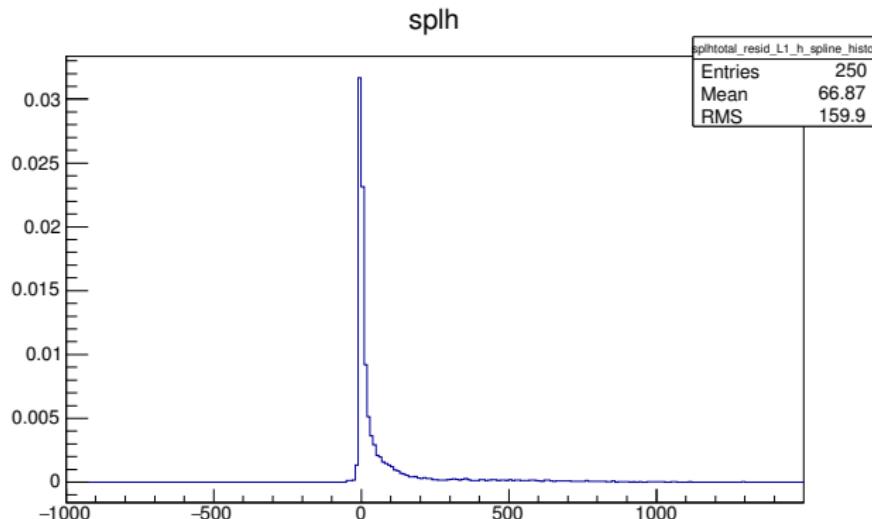

# Spline fit to residual

## Coincidence selection

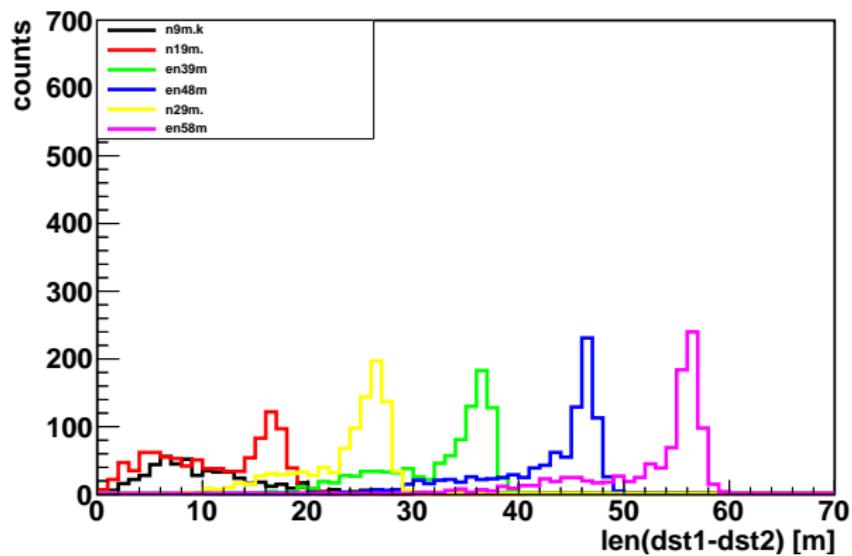

# Spline fit to residual

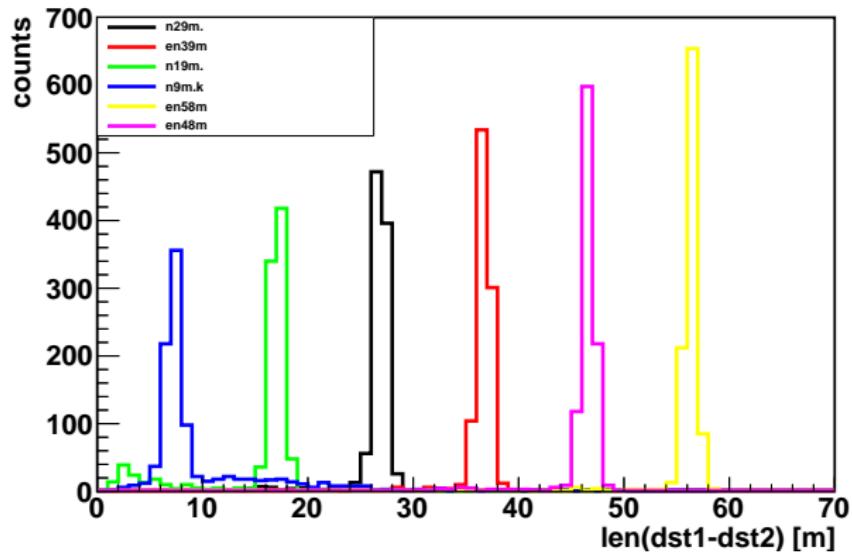

## L1 selection

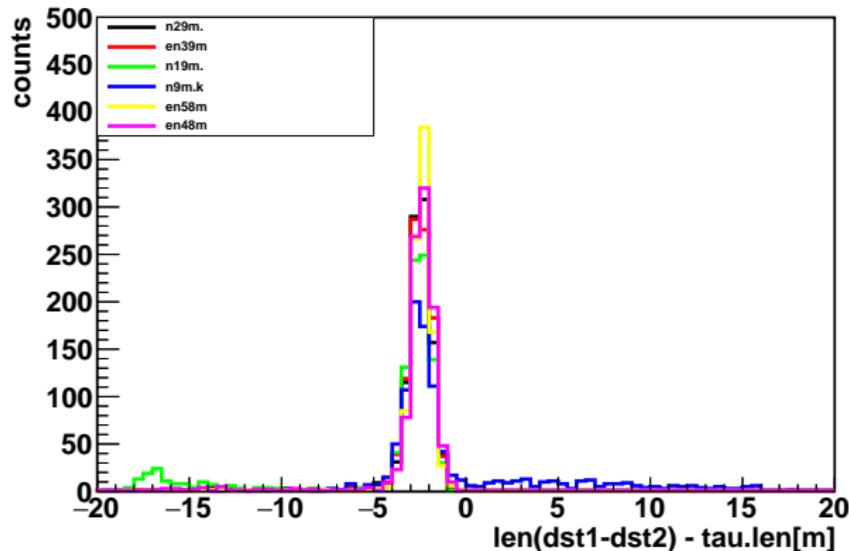

## Two shower fit performance: coincidence

## Two shower fit performance: L1

## Two shower fit performance: L1

## Two shower fit on single shower events
