Focus on flavour physics

Understanding how flavours of quarks change

Motivation

- Standard model of particle physics is incomplete → precision tests are necessary!
- Need good understanding and measurements of all free parameters

Parameters determined in different kinematical regions

Puzzles: values should be the same!

GAUGE BOSONS

- Charged weak interactions allow for flavour changes in the Standard Model
- Quark transition probabilities related to Cabibbo-Kobayashi-Maskawa matrix

$$V_{CKM} \equiv \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

Kobayashi, M., Maskawa, T., Prog. Theor. Phys., 49:652–657, 1973

Need to be measured! Used as inputs for predictions!

Kobayashi, M., Maskawa, T., Prog. Theor. Phys., 49:652-657, 1973

Need to be measured! Used as inputs for predictions!

The CKM matrix

Measuring the matrix elements

- Mostly extracted from data analysis of semi-leptonic decays
 - More data than leptonic decays
 - Only one hadron in the final state → cleaner theory predictions about decays
- e.g.: V_{ub} from $B_s^0 \rightarrow K^- \mu^+ \nu_\mu \Rightarrow$ compare branching ratio to theory expression

Quarks decay but hadrons are
observed

QCD problems reduced to
form factors

This talk = how to approach FF!

The CKM matrix

The $V_{ub} - V_{cb}$ puzzle

Same quark level transition
Should be the same!

- Inconsistency found when extracting V_{ub} and V_{cb} from **exclusive** or **inclusive** decays
 $b \rightarrow ul\nu$ $b \rightarrow cl\nu$

Final state is fully known

Hadronic part : specific form factors

Form factor calculations are not straight-forward : depend on momentum of lepton pair

Final state is sum of all possible states

Hadronic part : data

The CKM matrix

The $V_{ub} - V_{cb}$ puzzle

The CKM matrix

The $V_{ub} - V_{cb}$ puzzle

Same quark level transition
Should be the same!

- Inconsistency found when extracting V_{ub} and V_{cb} from **exclusive** or **inclusive** decays
 $b \rightarrow ul\nu$ $b \rightarrow cl\nu$

Also possible to determine
ratios experimentally!

Particle Data Group, 2022

Bernlochner, Welsch, Fael, Olschewsky, Persson, van Tonder, Vos, JHEP 10 (2022) 068

Extracting $|V_{ub}/V_{cb}|$ from $B_s^0 \rightarrow K^- \mu^+ \nu_\mu$

2012 data LHCb analysis – Method

- First observation of decay and determination of branching ratio
- Normalised to $B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu$: reduce experimental systematic uncertainty

$$\frac{\mathcal{B}(B_s^0 \rightarrow K^- \mu^+ \nu_\mu)}{\mathcal{B}(B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu)} = \frac{|V_{ub}|^2}{|V_{cb}|^2} \frac{\text{FF}_K}{\text{FF}_{D_s}}$$

Form factors are important theory input!

- FF_{D_s} available for full range of lepton pair momentum
- FF_K has **two** different theoretical determinations for **different q^2 ranges!** $q^2 = (p_\mu + p_\nu)^2$

Extracting $|V_{ub}/V_{cb}|$ from $B_s^0 \rightarrow K^- \mu^+ \nu_\mu$

2012 data LHCb analysis – Results

- First observation of decay and determination of branching ratio
- Normalised to $B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu$: two different q^2 ranges for $B_s \rightarrow K$ form factors!

Low q^2

FF determined with
Light-Cone Sum Rules

High q^2

FF determined with
Lattice QCD

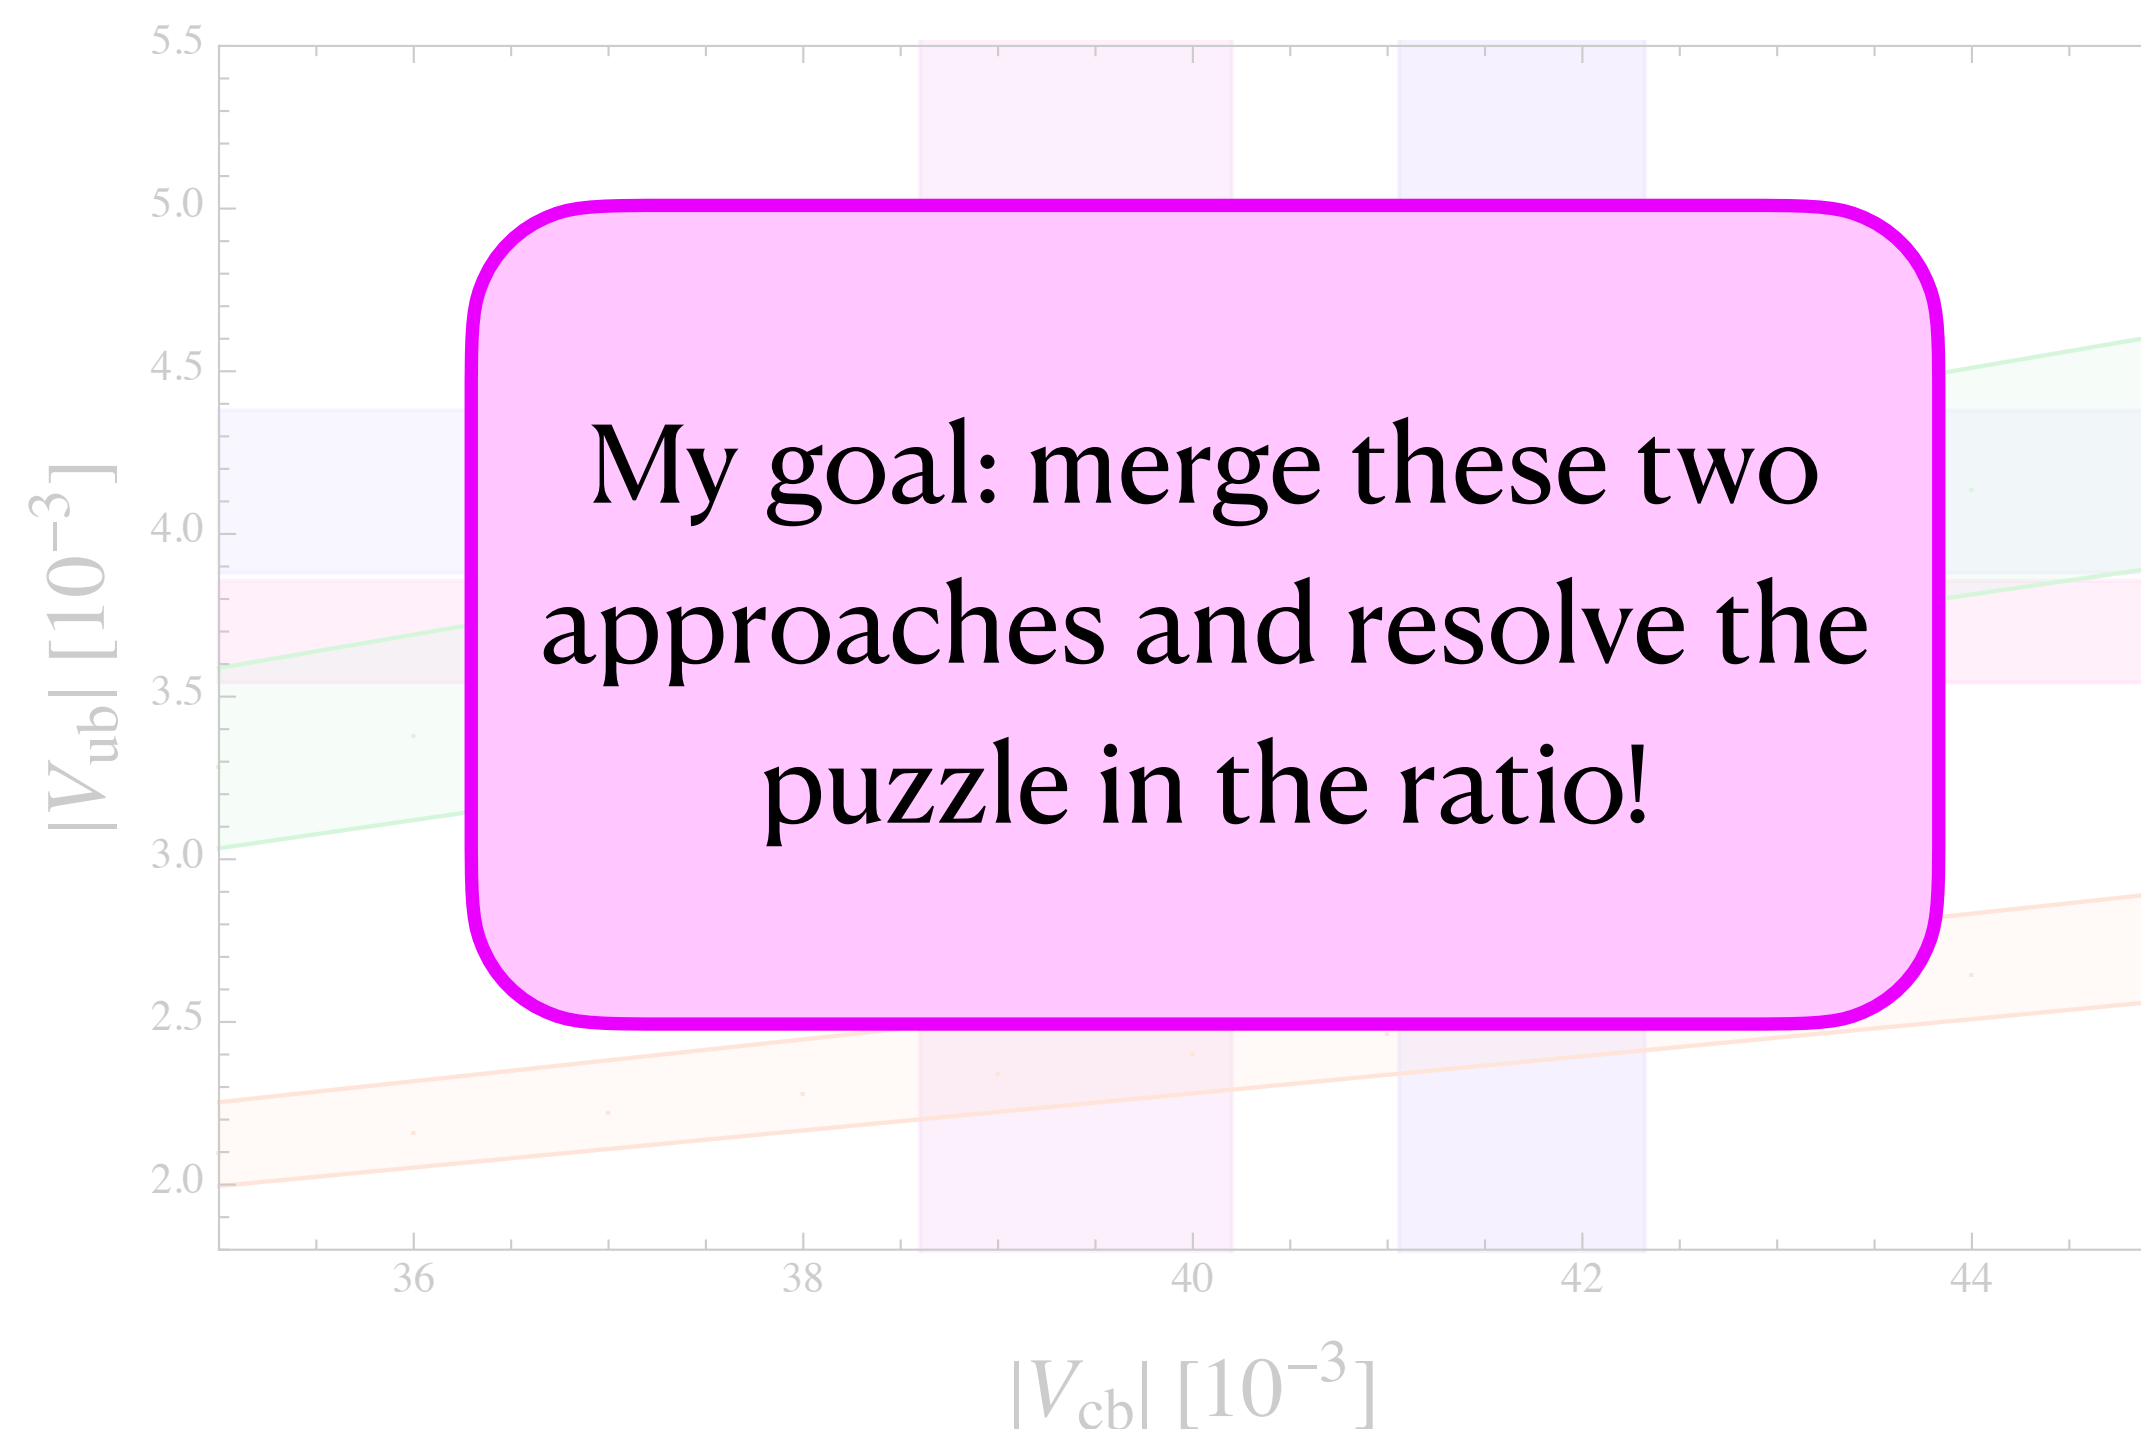

$$q^2 = (p_\mu + p_\nu)^2$$

LHCb Collaboration, Phys.Rev.Lett. 126 (2021) 8

Extracting $|V_{ub}/V_{cb}|$ from $B_s^0 \rightarrow K^- \mu^+ \nu_\mu$

2012 data LHCb analysis – Results

- First observation of decay and determination of branching ratio
- Normalised to $B_s^0 \rightarrow D_s^- \mu^+ \nu_\mu$: two different q^2 ranges for $B_s \rightarrow K$ form factors!

Low q^2

FF determined with
Light-Cone Sum Rules

High q^2

FF determined with
Lattice QCD

$$q^2 = (p_\mu + p_\nu)^2$$

Determining form factors

LCSR x LQCD

low q^2

Light-Cone Sum Rules (LCSR)

Write the hadrons in terms of currents

Expand these currents near the light-cone

Factorise out the non-perturbative part

Re-interpret in terms of sum of hadron states

→ Some approximations are needed in the calculations

high q^2

Lattice QCD (LQCD)

Discretise spacetime and calculate: grid introduces natural regularisation of lengths and momenta

→ Computationally intensive : large grids and small spacing

EPJ Web Conf. 245 (2020) 09008

Improving form factor determination

Extrapolating LCSR to LQCD : $B \rightarrow \pi$ example

Standard previous approach:

- Calculate form factors with LCSR for several low q^2 values
- Use standard parametrisation to extrapolate to high q^2
- Parametrisation gives large uncertainty at high q^2

Improving form factor determination

Extrapolating LCSR to LQCD : $B \rightarrow \pi$ example

New approach:

- Calculate form factors with LCSR for several low q^2 values
- Use adapted parametrisation to extrapolate to high q^2
- Fit LCSR points and LQCD points together with new parametrisation

New approach to $B_s \rightarrow K$

Ongoing project

With Danny van Dyk and Keri Vos

New determination of the form factors: how will it impact the CKM elements?

New approach to $B_s \rightarrow K$

Ongoing project

With Danny van Dyk and Keri Vos

New determination of the form factors: how will it impact the CKM elements?

Currently...

Exclusive
Inclusive
Low q^2 ratio
High q^2 ratio

New approach to $B_s \rightarrow K$

Prospective

With Danny van Dyk and Keri Vos

New determination of the form factors: how will it impact the CKM elements?

Improve V_{ub} exclusive?

Resolve $|V_{ub} / V_{cb}|$ ratio!

Conclusion

- CKM elements are important input parameters in the Standard Model
 - ★ Currently there are inconsistencies between exclusive and inclusive determinations
- Improving theoretical form factor calculations may help resolve these inconsistencies
- A new approach appears! Work in progress with $B_s \rightarrow K$ form factors
 - ★ Unify low and high q^2 determinations in one go!
- Will the new CKM element and ratio increase or reduce the puzzle?

Thank you!

Determining form factors

Definition

- Cannot be calculated perturbatively due to large coupling constant at low energies
- Describe how the current flows from the B meson to the final meson ($D, K, \pi \dots$)

The CKM matrix

Measuring the matrix elements

- Mostly extracted from data analysis of semi-leptonic decays
 - More data than leptonic decays
 - Only one hadron in the final state → cleaner theory predictions about decays

$$V_{CKM} \equiv \begin{pmatrix} V_{ud} & V_{us} & V_{ub} \\ V_{cd} & V_{cs} & V_{cb} \\ V_{td} & V_{ts} & V_{tb} \end{pmatrix}$$

Same family transitions most enhanced

Hierarchical structure just measured, not modelled

Big suppression of transitions between 1st and 3rd families

Particle Data Group, 2022

Outline

- The CKM matrix
- The $V_{ub} - V_{cb}$ puzzle
- Extraction of $|V_{ub}/V_{cb}|$ from $B_s^0 \rightarrow K^- \mu^+ \nu_\mu$: relevance of $B_s \rightarrow K$ form factors
- Different methods of calculating form factors
- New approach to form factors \Rightarrow light-cone sum rules into lattice QCD
