

## Introducing the VSI LHCb Team

Kristof De Bruyn

VSI meeting January 30th, 2023

# The VSI LHCb Team

**Antonio Pellegrino**

Professor by special appointment  
SciFi detector

**Gerco Ondewater**

Associate Professor  
Director School of Science and Engineering

**Kristof De Bruyn**

Assistant Professor  
VELO detector & Study of  $B_c^+ \rightarrow \tau \nu$

**Mick Mulder**

Postdoc  
Study of  $\Lambda_b$  decays

**Jan de Boer**

PhD  
SciFi detector & Study of  $\Lambda_b$  decays

**Maria Domenica Galati**

PhD  
VELO detector & Study of  $B_c^+ \rightarrow \tau \nu$

**Andrej Sarnatskiy**

MSc student  
Production of  $B_c^+$  at LHCb

# The Large Hadron Collider

# Two Complementary Strategies for the Large Hadron Collider

arxiv:1406.3827

LHCb-PAPER-2021-007

## Direct Searches (High Energy Frontier\*):

Search for new on-shell resonances

- *Bump-hunting*
  - Select  $x$  leptons +  $y$  jets  
(= observed decay products)
  - Require some missing energy  
(= undetected decay products)

\* Not to be confused with the VSI base units

## Indirect Searches (Precision Frontier\*):

Search for differences with SM predictions

- Higgs Sector
- (Heavy) Flavour Sector
  - Asymmetries
  - Rare decays

# The B Meson Family

- ▶ Unstable particles (lifetime  $\approx 1.5 \times 10^{-12}$  seconds)
- Experimental advantage: can fly 1 to 2 cm away from production point before decaying
- ▶ More than 250 different decay paths
- ▶ Observables: branching fractions, asymmetries, angular correlations, ...
- ▶ Allows us to probe many SM parameters and perform high precision tests

# The Power of Indirect Searches

## Standard Model

?  
+

## New Physics

- Sensitive to new virtual contributions  
→ Both at tree level and in loops
- Can probe energy scales much beyond LHC energy limit
- Many NP models predict new heavy particles that prefer coupling to **third generation**
- Matter-antimatter differences are largest in transitions involving **third generation**

Beauty

# The Large Hadron Collider beauty Experiment

# Upgrading the LHCb Detector

## ► Aim:

- 1 Significantly reduce the statistical uncertainty on the measurements ( $\sqrt{n}$ )
- 2 A more flexible trigger to select interesting events and reject uninteresting ones

## ► To achieve this:

- Increase the number of interactions per proton bunch crossing from 1.1 to 5
- Upgrade complete detector to **triggerless read-out** at 40MHz

## ► Requires a complete redesign of the data acquisition (Hardware + Software)

# The Vertex Locator

## The Team:

- Construction
- Commissioning

# The Scintillating-Fibre (SciFi) Detector

## The Team:

- Construction
- Commissioning

# Testing Lepton Flavour Universality

► Do electrons, muons and tau leptons behave the same?

The Team:

$B_c^+ \rightarrow \tau \nu$

$\Lambda_b$  Decays
