

Resource Trust Evolution

A couple of discussion points

Current highest priorities

- Fermilab certificate situation
 - Talking to Mine, understood that InCommon is now fully operational
 - Question is what happens if there are future issues
 - UK eScience CA can provide support but would still need to understand appropriate local resourcing for proper support
- Cloud (and other) workflows
 - In CERN, discussion ultimately focused on understanding security risk implications of whole cloud workflows (perhaps I am biased ;-)
 - In a context where we are extremely constrained in carrying out risk assessments, what would a useful way of approaching this be?
