Friday 03 Nov 2023

# Cosmic rays

- Mainly protons, but also heavier nuclei
- Energies can exceed Large Hadron Collider ( $10^{13}$  eV) with a factor  $10^6$  or more

## Questions

1. What is their origin?
2. How do they obtain these energies?

**Photons**

**Charged particles**

**Photons**

**Charged particles**

**Photons**

**Neutrinos**

# Water

**Charged current  
interaction**

$\nu_\mu$

**Cherenkov light**

# KM<sub>3</sub>NeT/ARCA

# A growing detector

## KM3NeT/ARCA

- Analysis includes data taken May 2021 - December 2022
- Detector configurations with 6-8-19-21 detection lines (DU)
- Currently operating 28 strings (of final 230)

# A growing detector

## KM3NeT/ARCA

- Analysis includes data taken May 2021 - December 2022
- Detector configurations with 6-8-19-21 detection lines (DU)
- Currently operating 28 strings (of final 230)

# A growing detector

## KM3NeT/ARCA

- Analysis includes data taken May 2021 - December 2022
- Detector configurations with 6-8-19-21 detection lines (DU)
- Currently operating 28 strings (of final 230)

# A growing detector

## KM3NeT/ARCA

- Analysis includes data taken May 2021 - December 2022
- Detector configurations with 6-8-19-21 detection lines (DU)
- Currently operating 28 strings (of final 230)

# A growing detector

## KM3NeT/ARCA

Growing detector leads to

- Higher acceptance  
—> More neutrinos / day

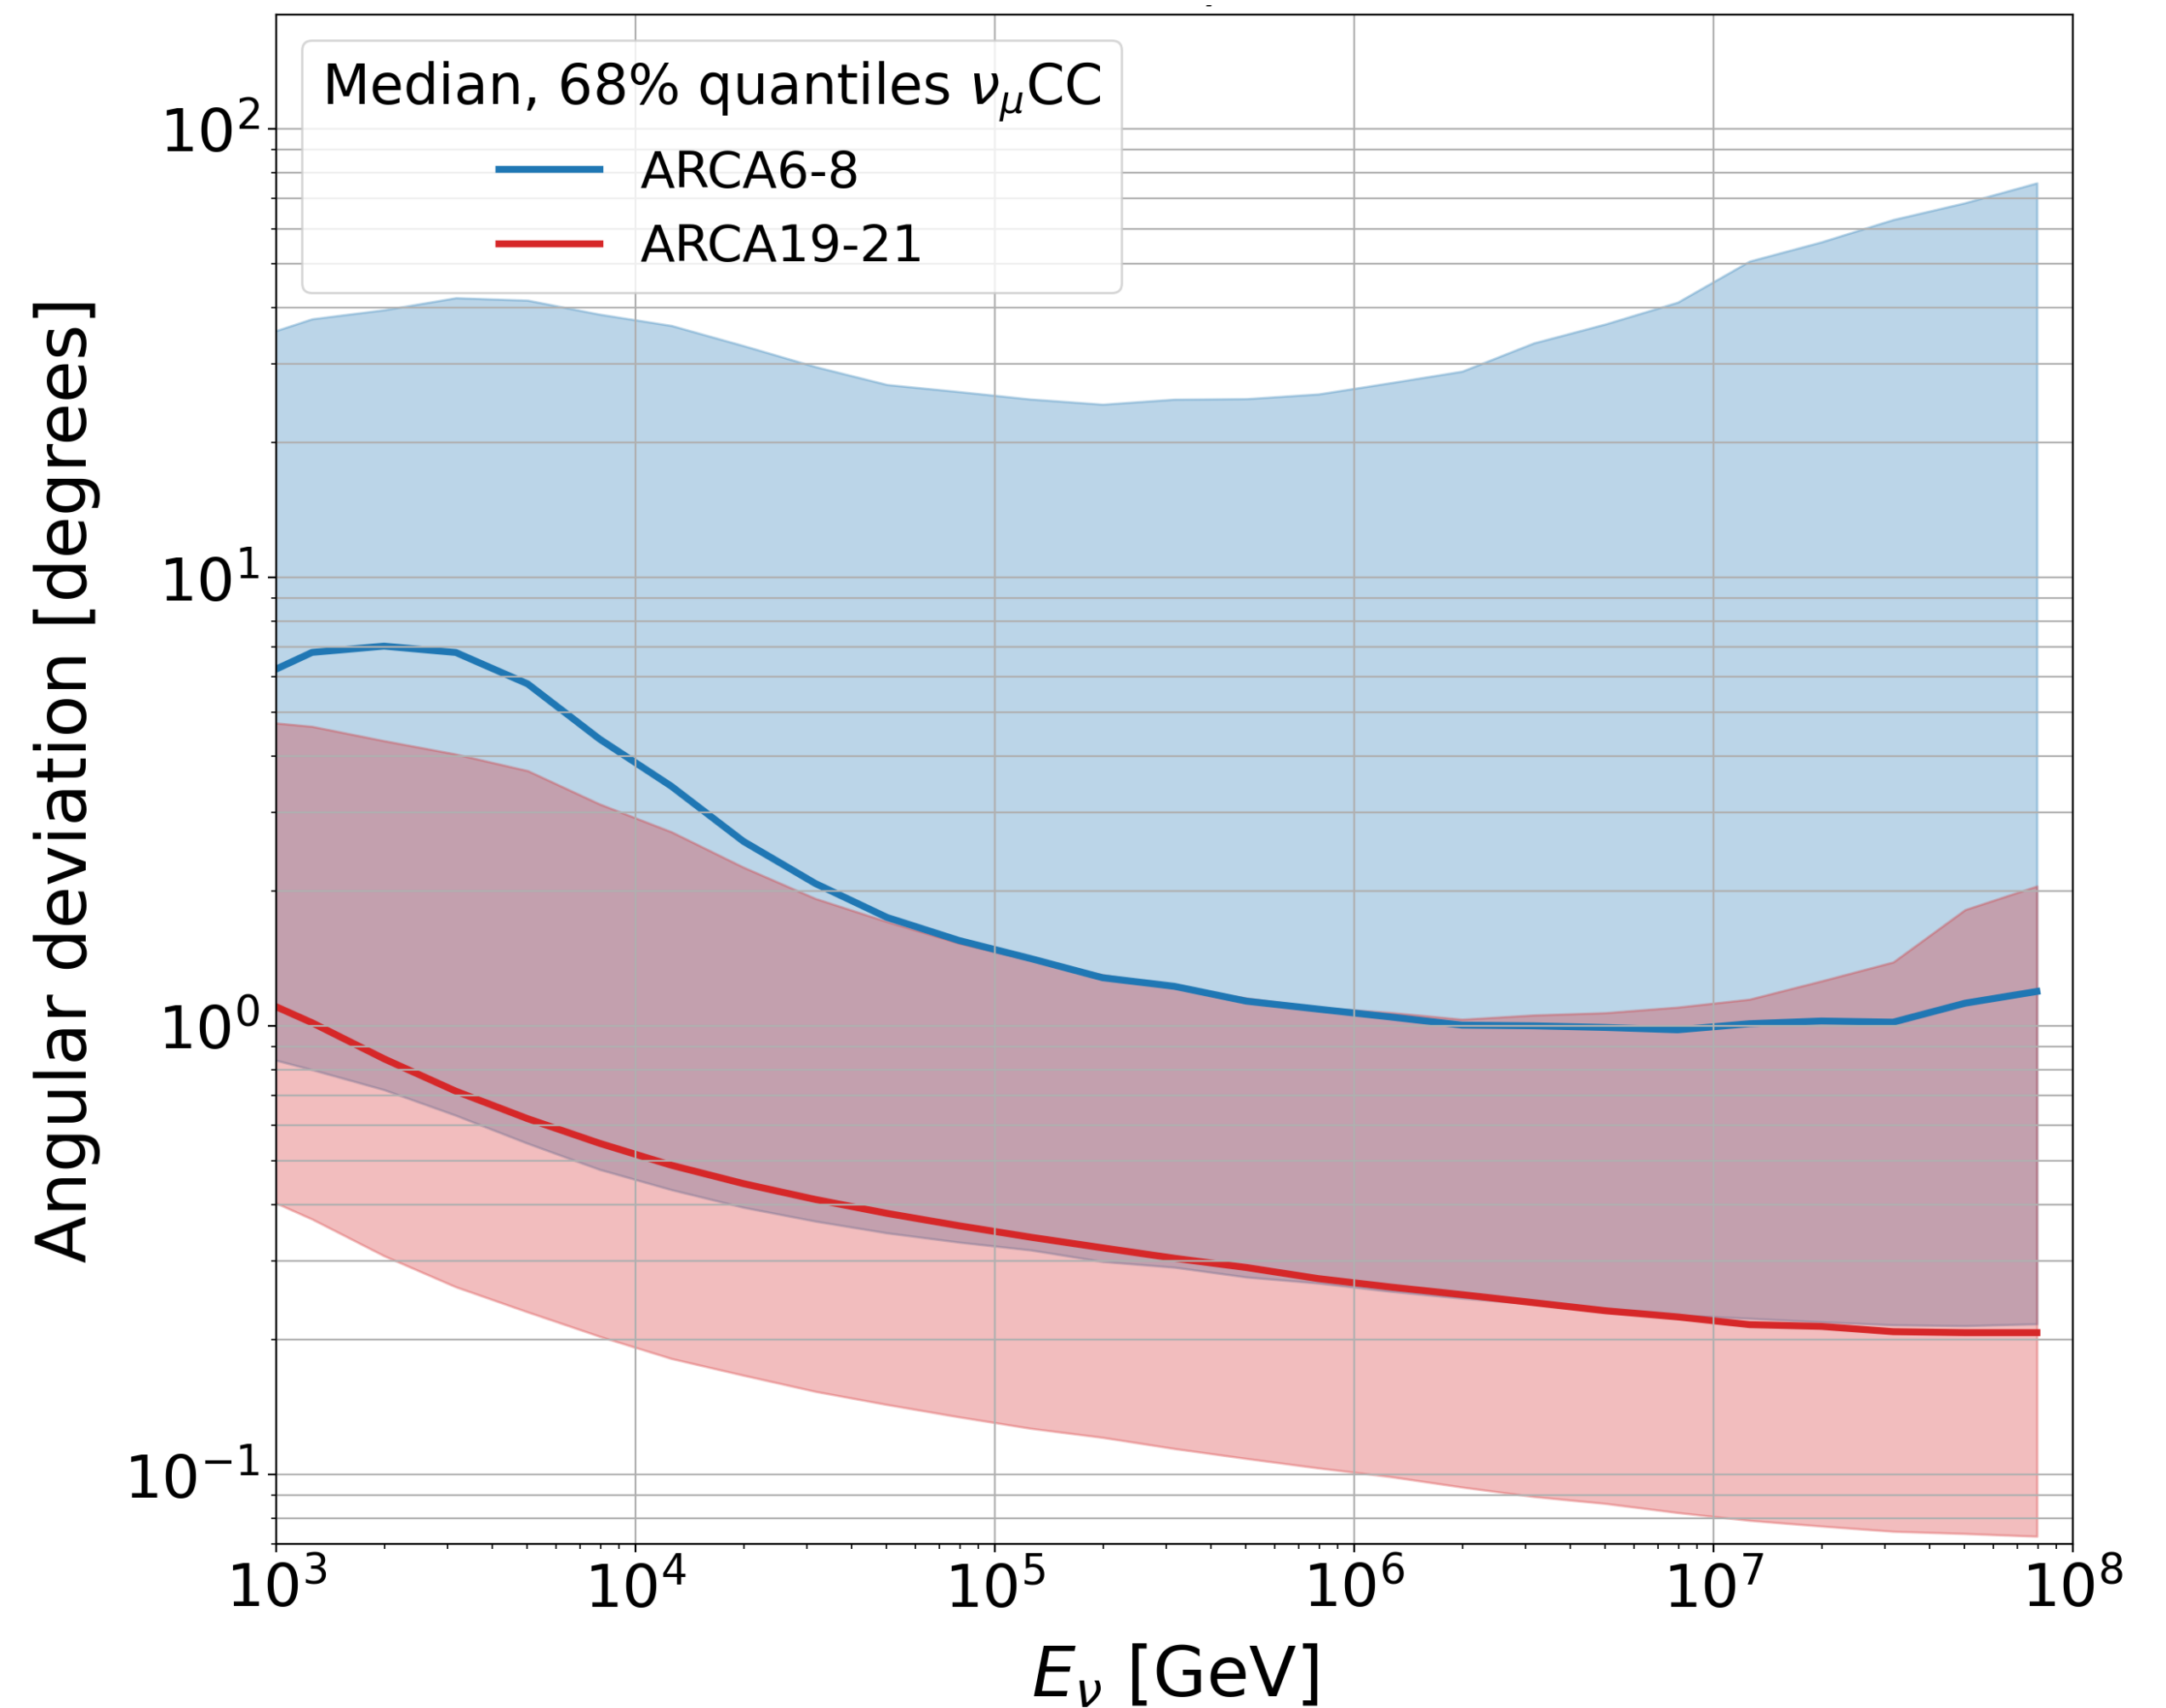

# A growing detector

## KM3NeT/ARCA

Growing detector leads to

- Higher acceptance
- Better detector resolution

# A growing detector

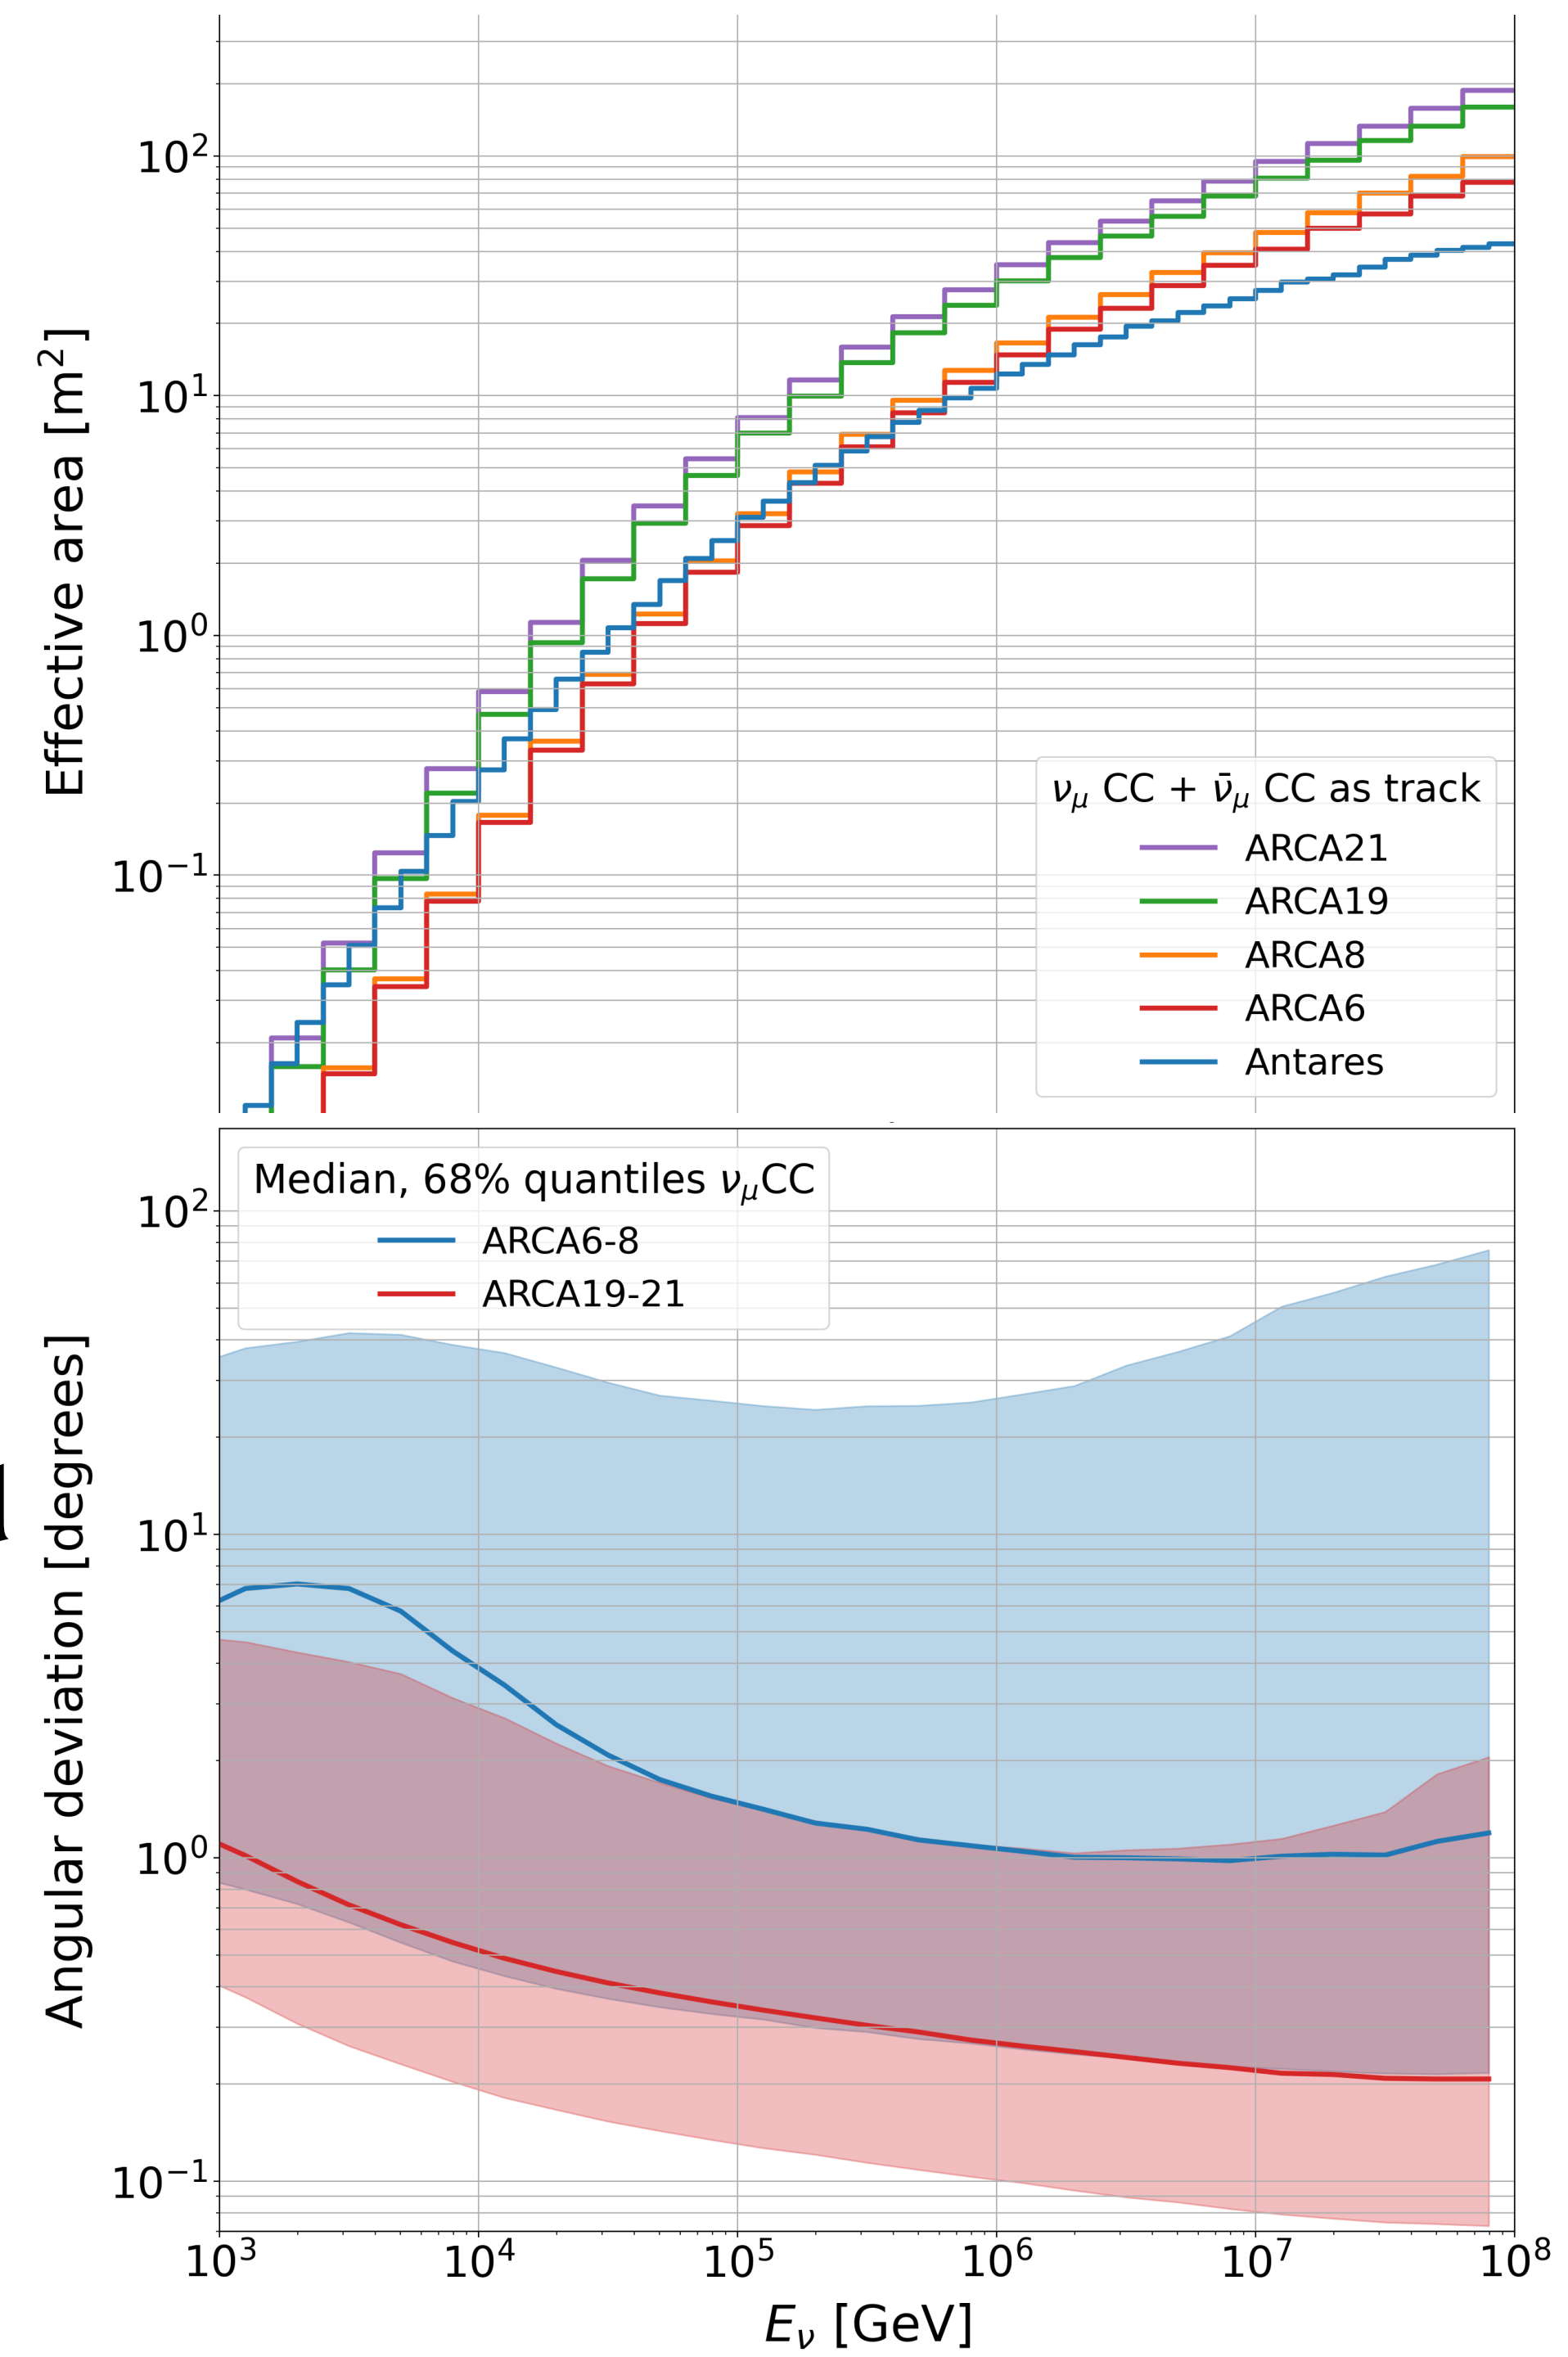

## KM3NeT/ARCA

Growing detector leads to

- Higher acceptance
- Better detector resolution

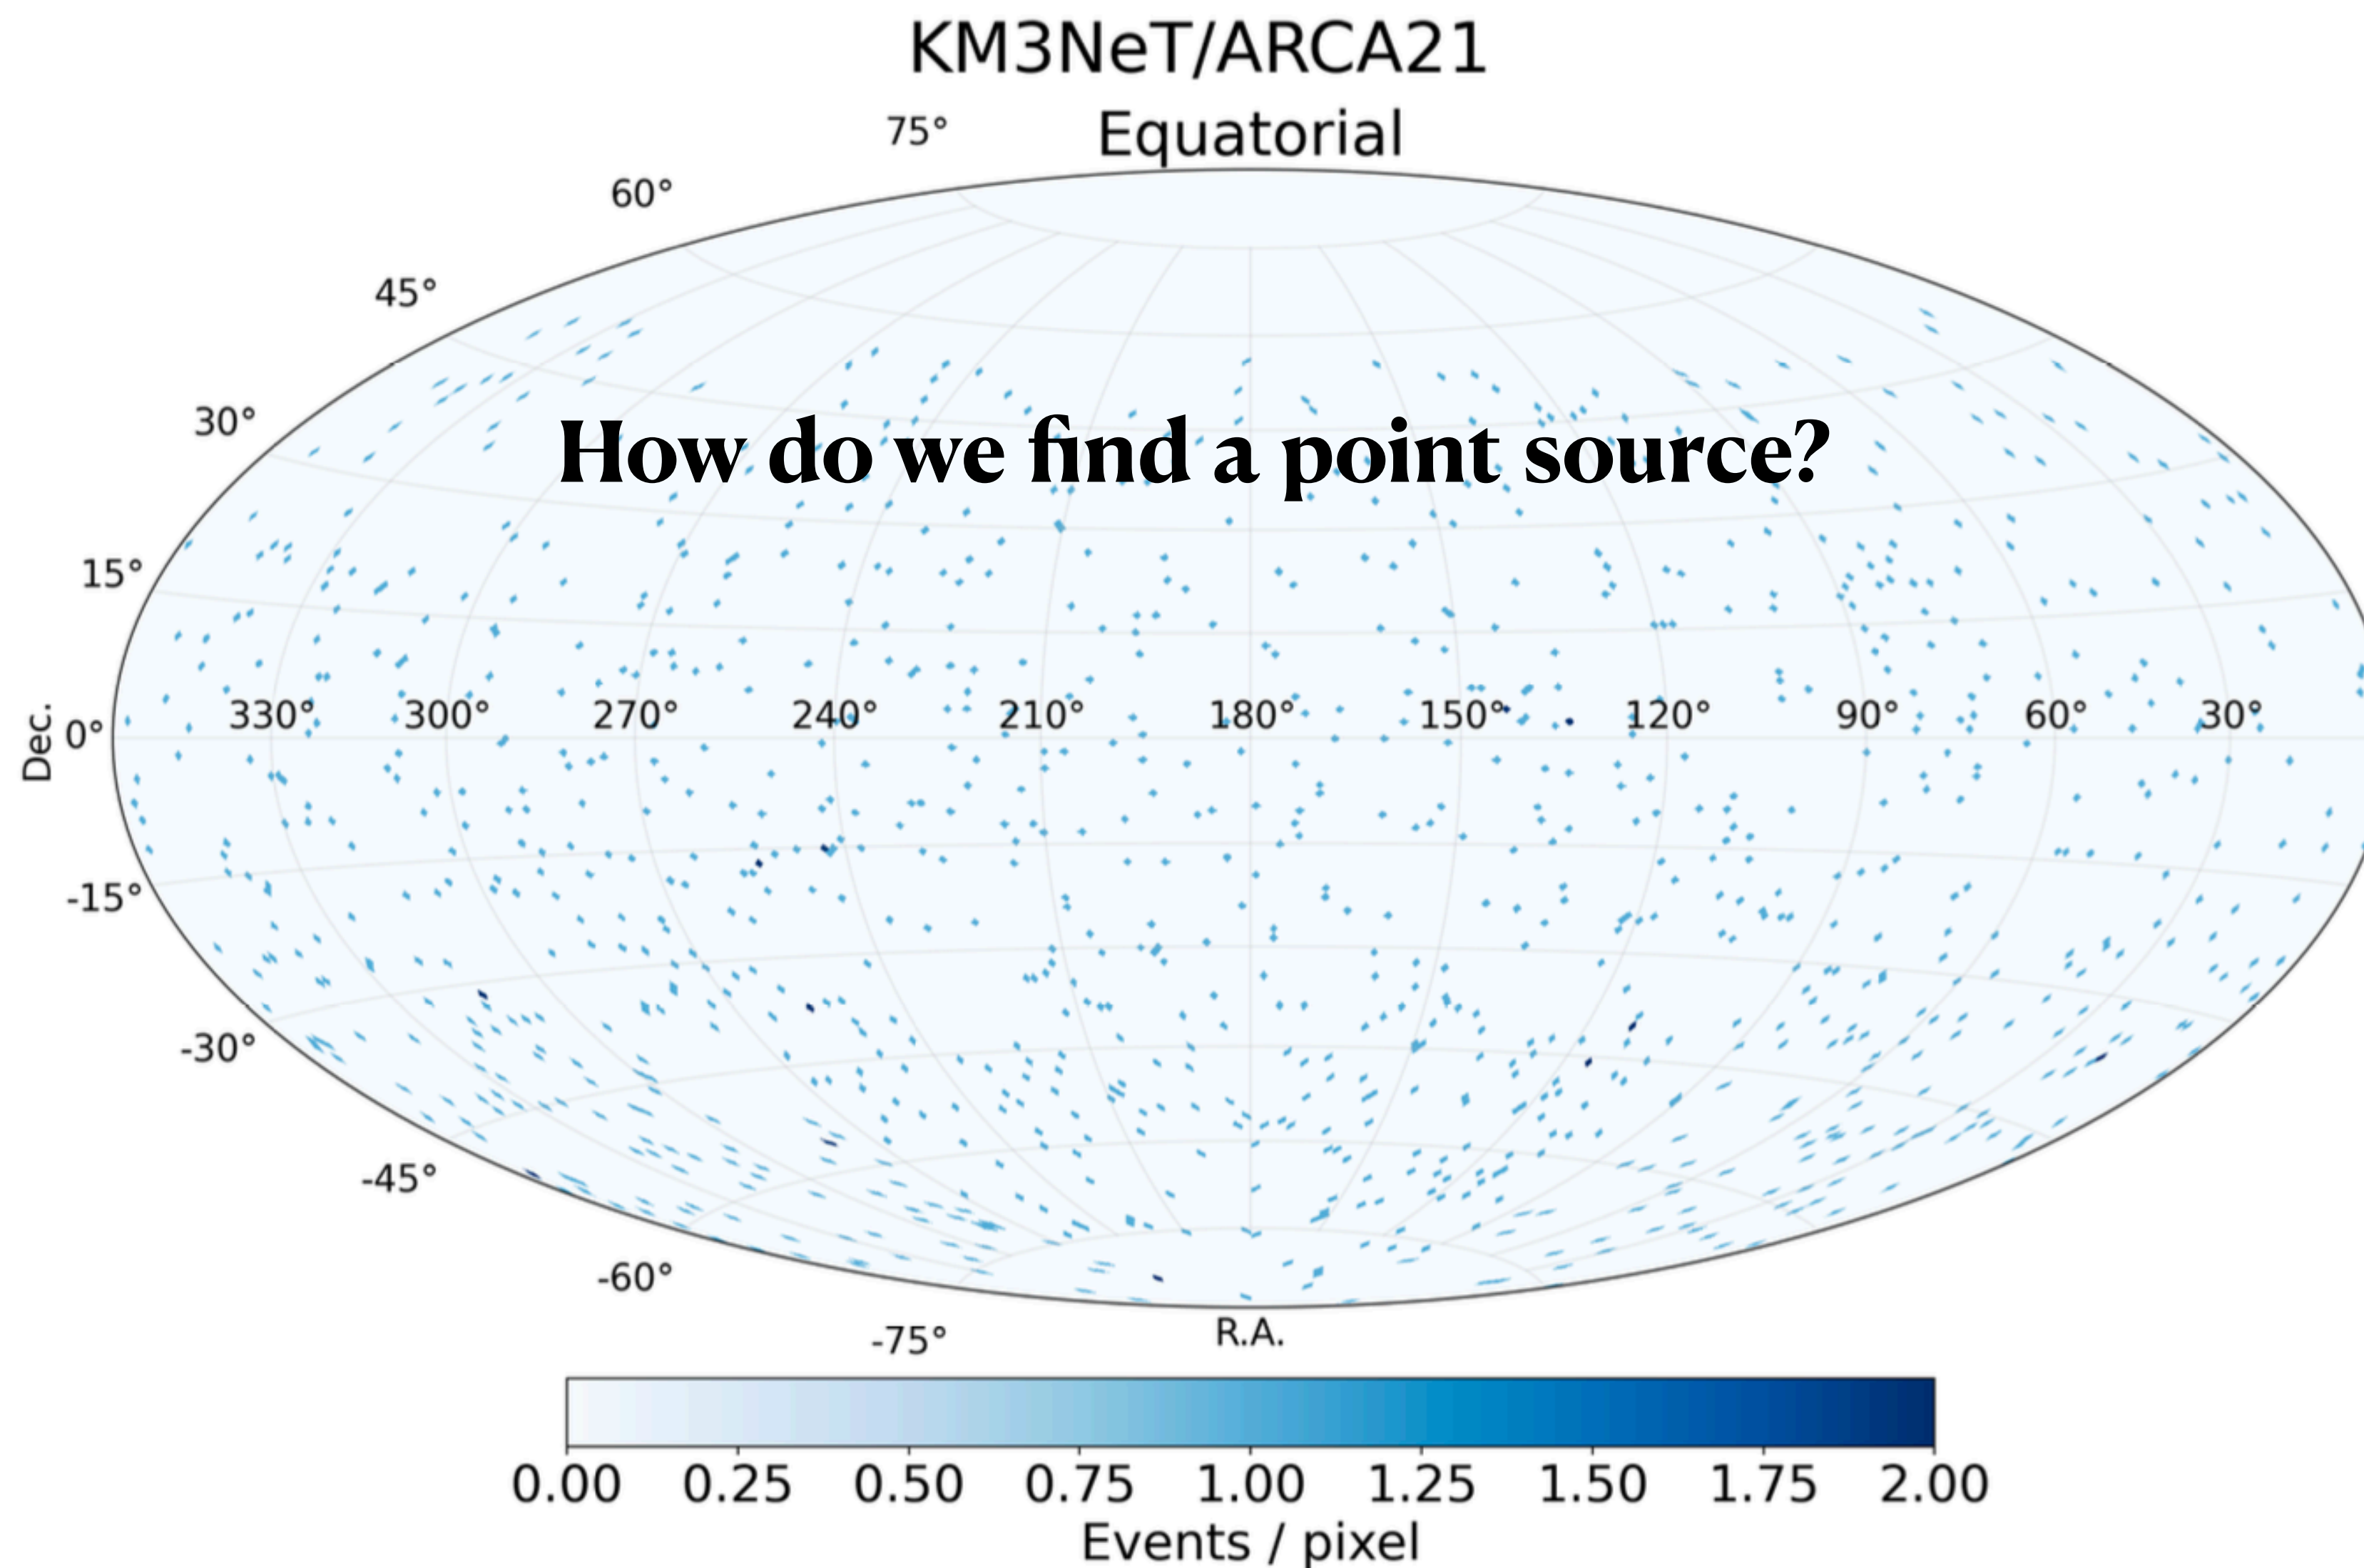

Easier to discriminate signal from background

Period	Atmospheric muons	Atmospheric neutrinos	Cosmic neutrinos
ARCA6-8	13278	746	9.4
ARCA19-21	545	804	7.0

# Neutrino Point Sources

# Candidate Sources

101 candidate sources

- Interesting objects from other  $\nu$  telescopes

# Method

## Source flux model

$$\phi_{\nu} = \phi_0 \times E^{-\gamma}$$

$$\gamma = 2.0, 2.5, 3.2$$

# Method

## Source flux model

$$\phi_\nu = \phi_0 \times E^{-\gamma}$$

$$\gamma = 2.0, 2.5, 3.2$$

## Detector response functions

## Method

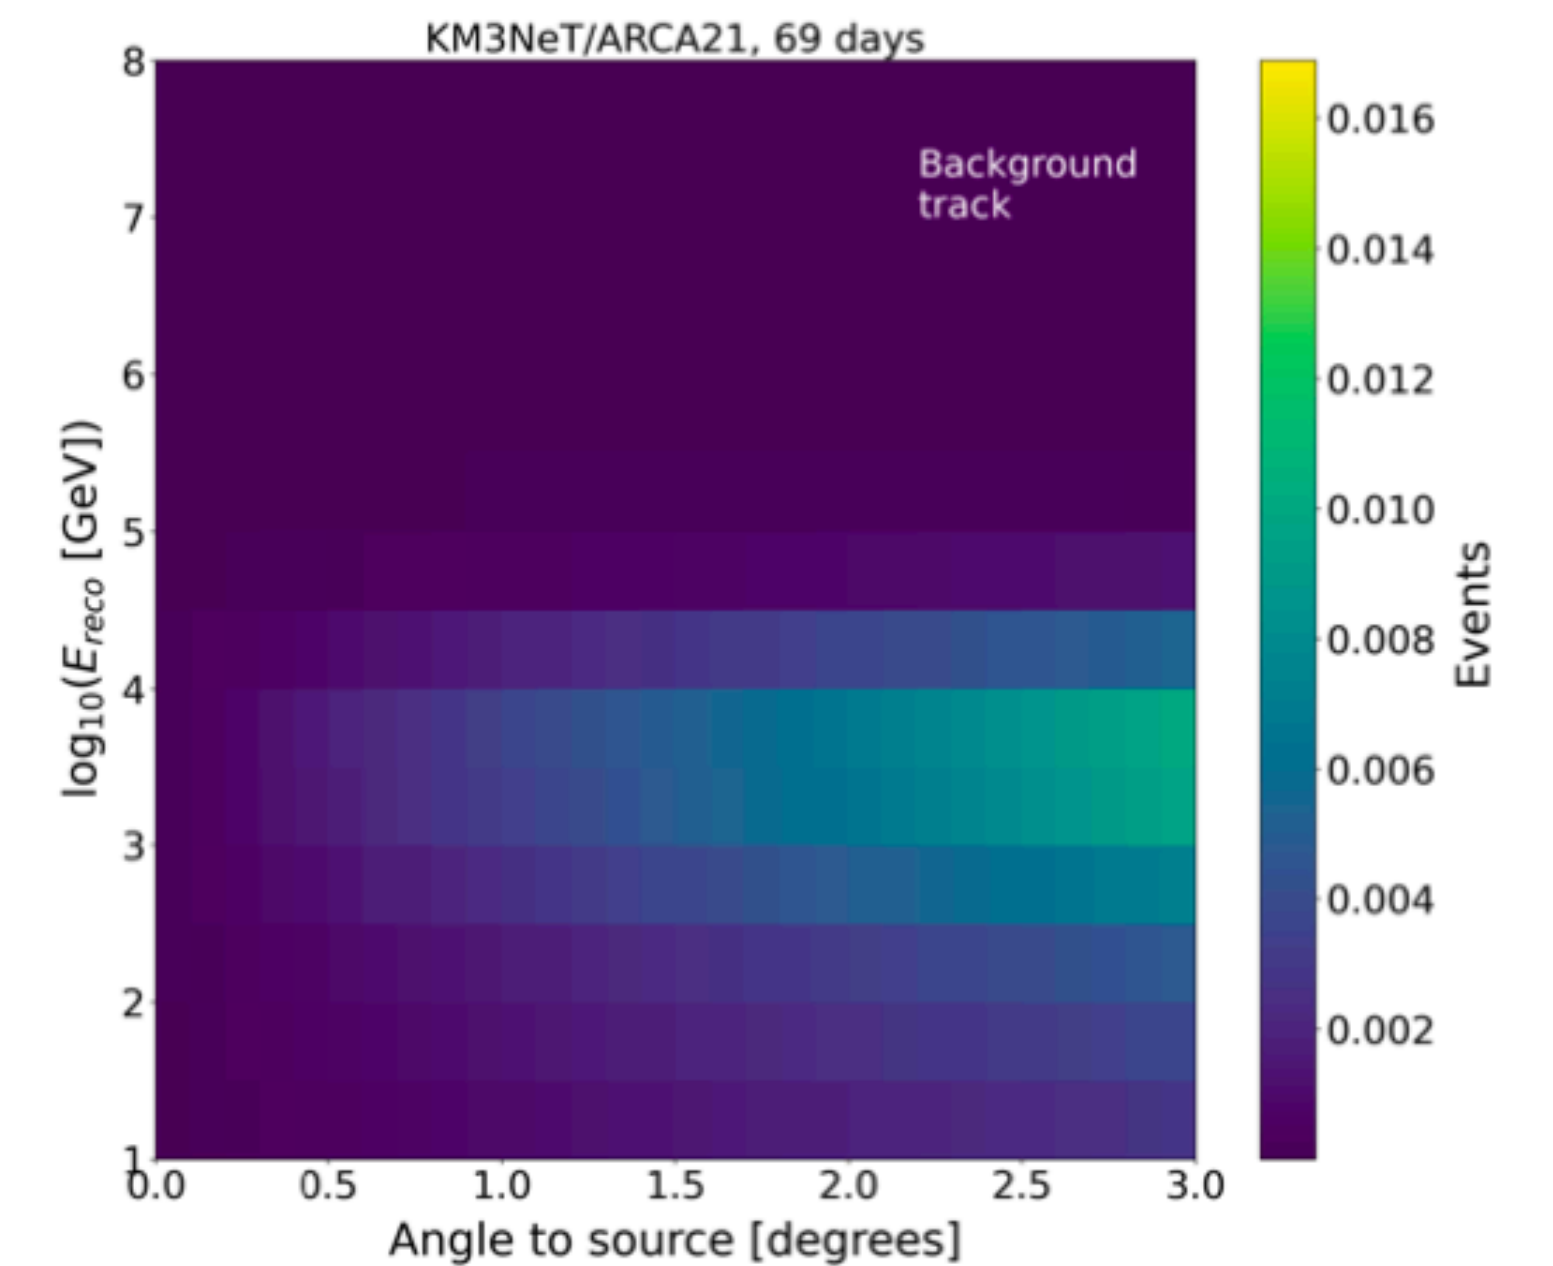

### Source flux model

$$\phi_\nu = \phi_0 \times E^{-\gamma}$$

$$\gamma = 2.0, 2.5, 3.2$$

### Detector response functions

# Expected signal & background

## Method

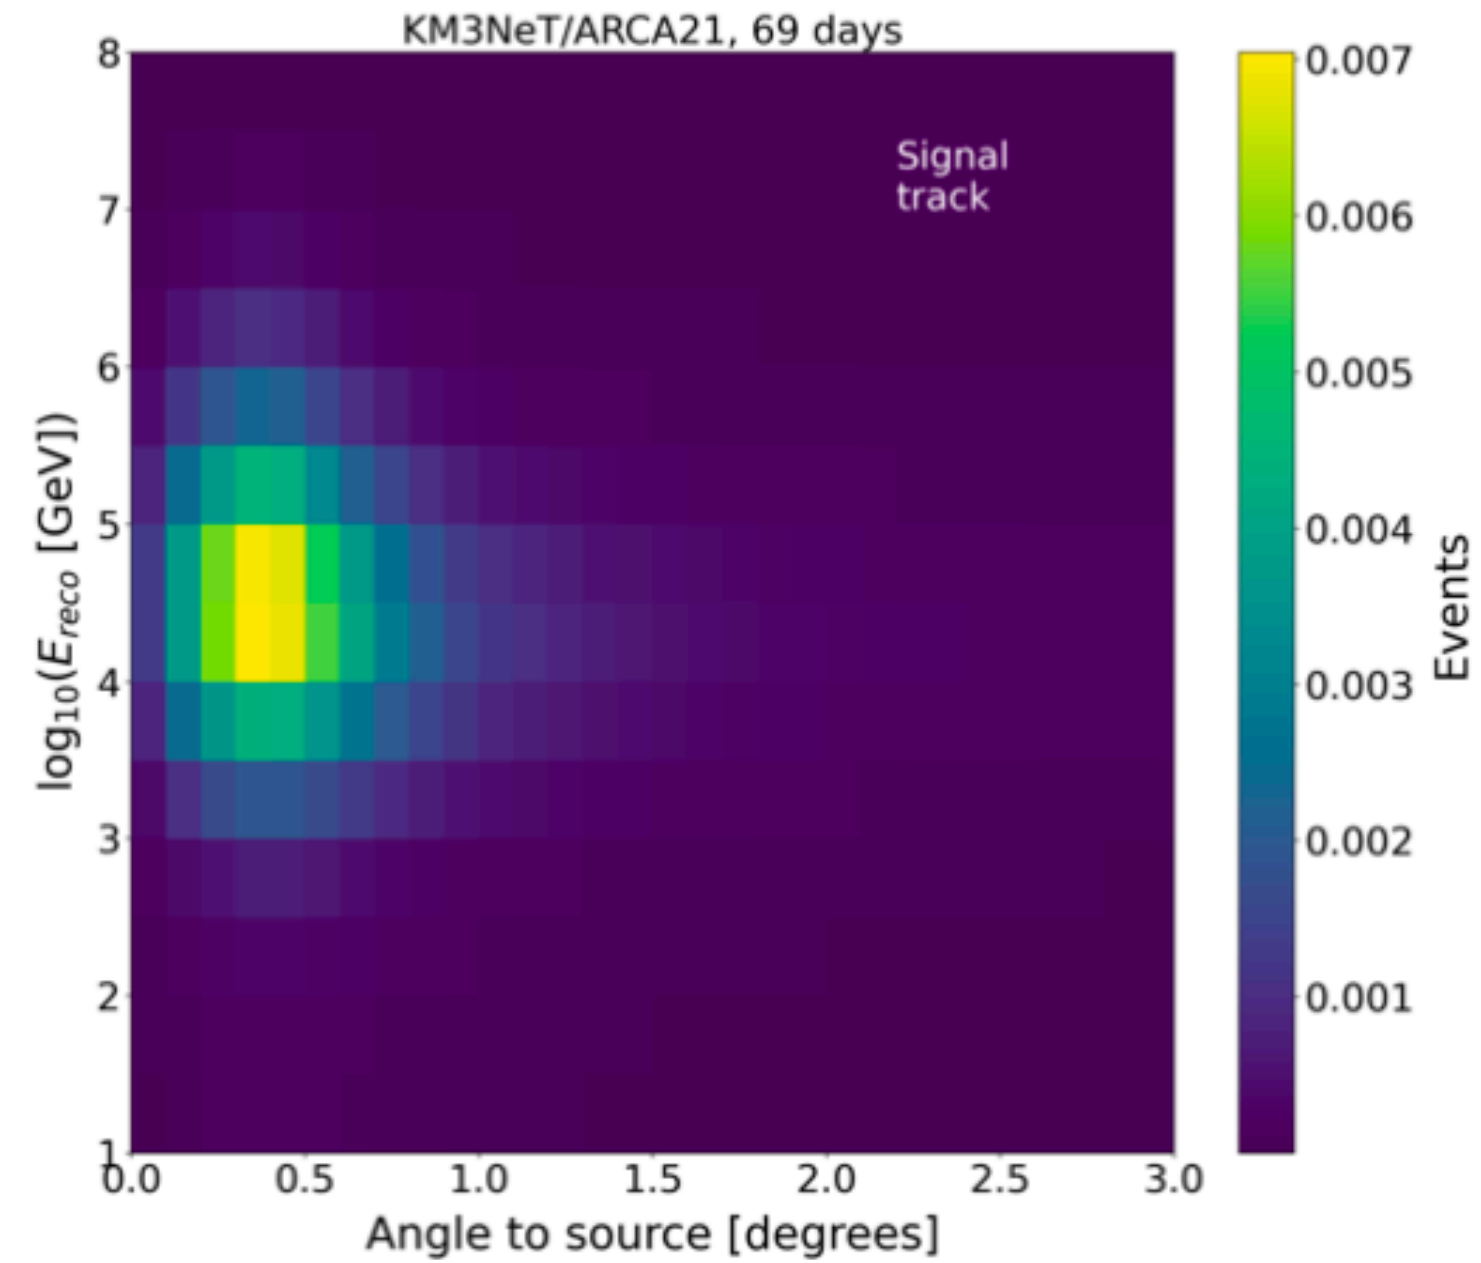

Pseudo experiments  
with varying  $\phi_0$

$$\phi_\nu = \phi_0 \times E^{-\gamma}$$

# Expected signal & background

## Method

Pseudo experiments  
with varying  $\phi_0$

$$\phi_\nu = \phi_0 \times E^{-\gamma}$$

## Test statistic

Log likelihood ratio with

$$\log \mathcal{L} = \sum_{i \in \text{bins}} = N_i \log(B_i + S_i) - B_i - S_i$$

# Expected signal & background

## Method

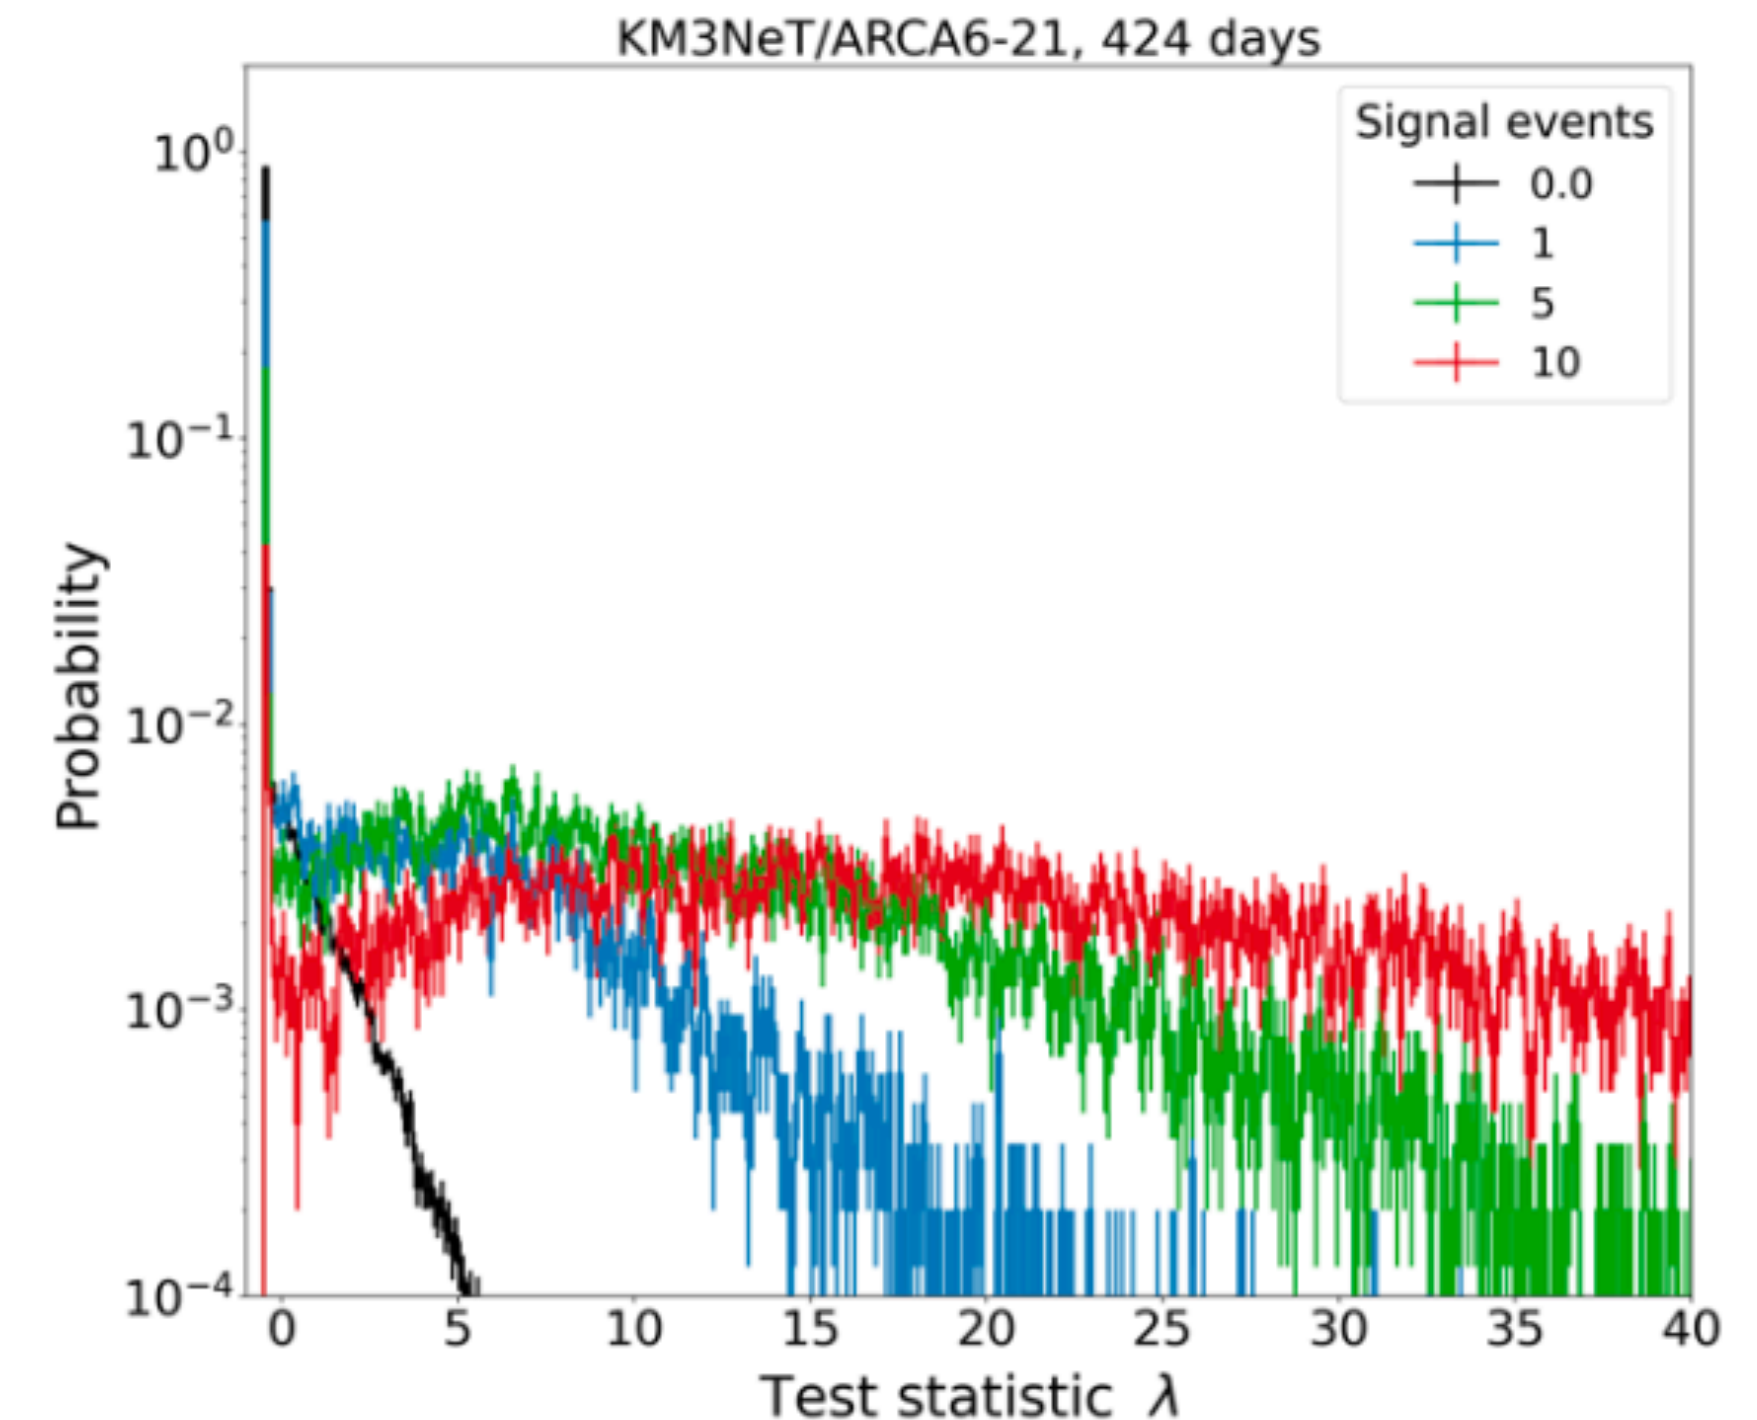

Pseudo experiments  
with varying  $\phi_0$

$$\phi_\nu = \phi_0 \times E^{-\gamma}$$

Test statistic

Log likelihood ratio with

$$\log \mathcal{L} = \sum_{i \in bins} = N_i \log(B_i + S_i) - B_i - S_i$$

Results...

**Results...**

**None of the 101 candidate sources is significantly  
detected...**

# Results

The most signal-like sources are:

$\gamma = 2$ : Active galactic nucleus J1512-0905

- Pre-trial p-value = 0.011
- Post-trial p-value = 0.66

Note: dataset is dominated by atmospheric muons from ARCA6-8 period

# Results

The most signal-like sources are:

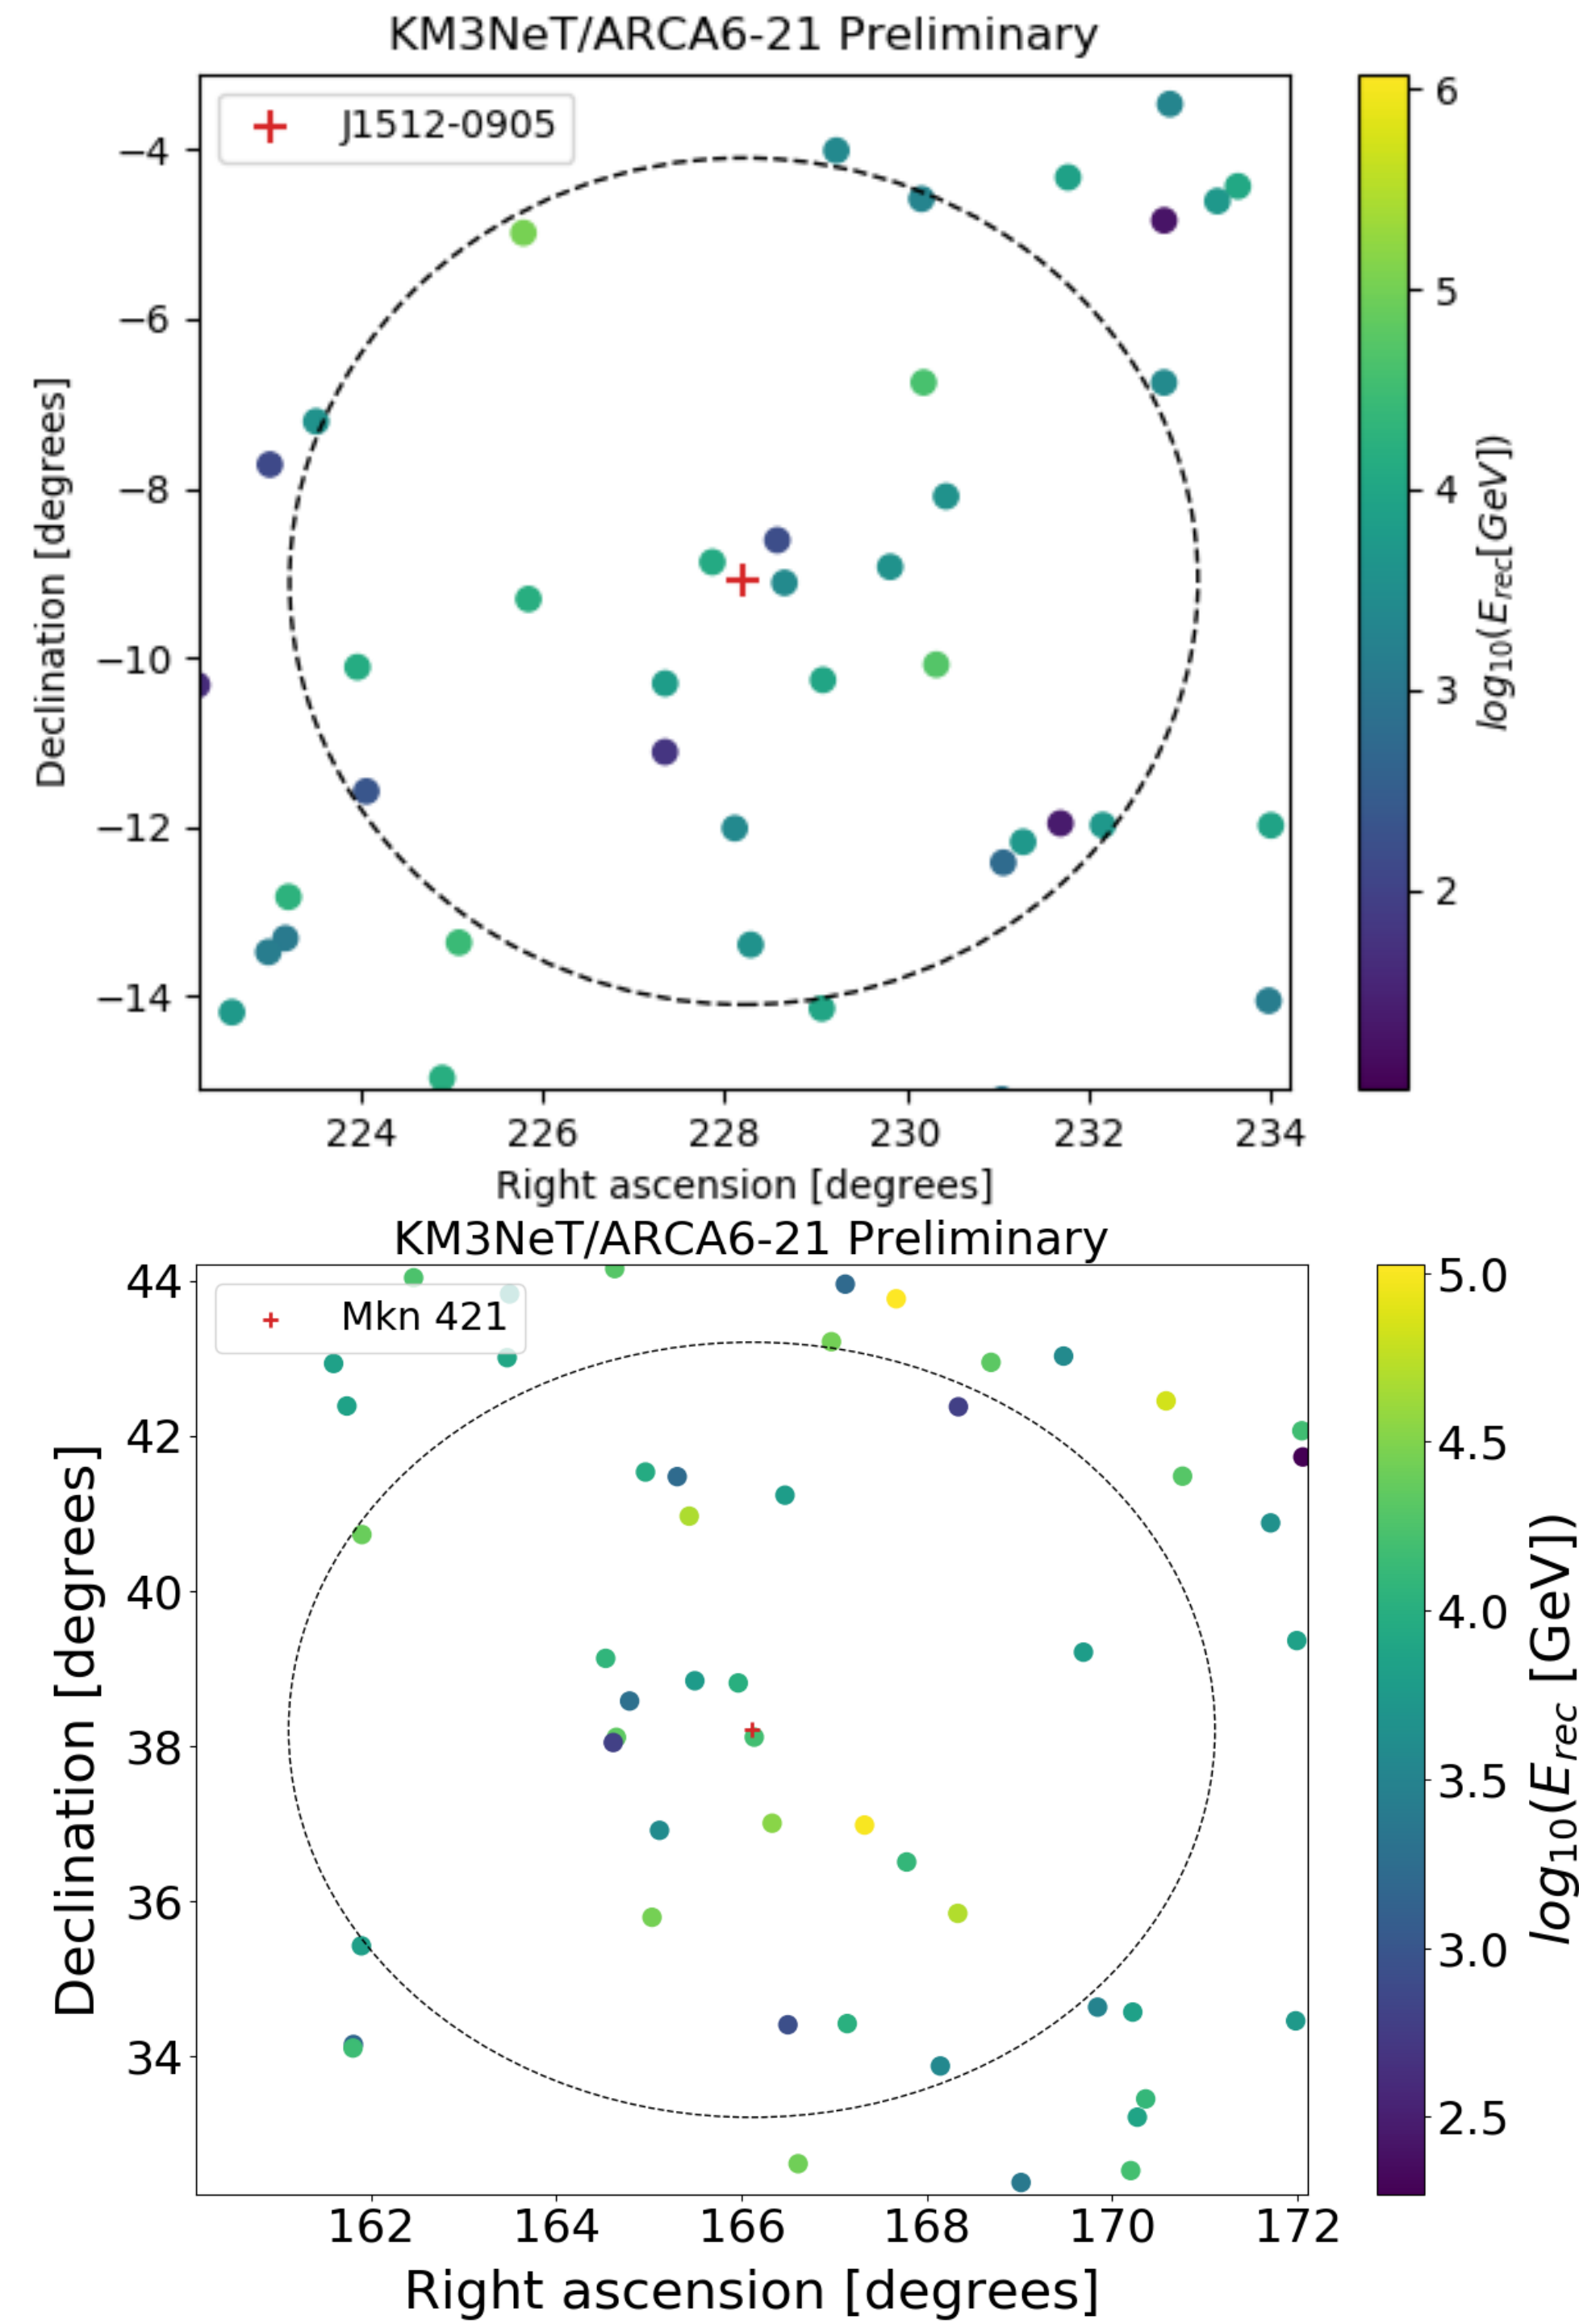

$\gamma = 2$ : Active galactic nucleus **J1512-0905**

- Pre-trial p-value = 0.011
- Post-trial p-value = 0.66

$\gamma = 2.5$ : Bright blazar **Mkn 421**

- Pre-trial p-value = 0.020
- Post-trial p-value = 0.56

Note: dataset is dominated by atmospheric muons from ARCA6-8 period

# Observed limits

- No significant detection made  
—> Set limits on  $\phi_\nu$
- $\phi_\nu$  that would give higher test statistic than observed in 90% of the cases
- Growing detector and dataset  
—> Sensitivity becomes competitive

# Take home message

The KM3NeT/ARCA detector is growing rapidly and improving the sensitivity to discover neutrino point sources

# Backup

## Most signal like sources: J1512-0905

$\gamma = 2$ : Active galactic nucleus J1512-0905

- Pre-trial p-value = 0.011
- Post-trial p-value = 0.66

New theories suggest regions where neutrinos are produced are opaque to  $\gamma$ -rays  
—> So we also search for blazars with very bright radio component

# Backup

## Most signal like sources: Mkn 421

$\gamma = 2.5$ : Bright blazar **Mkn 421**

- Pre-trial p-value = 0.020
- Post-trial p-value = 0.56

Variable and intense  $\gamma$  ray emission

Suspected to be a supermassive black hole
