

Threshold scans with no source

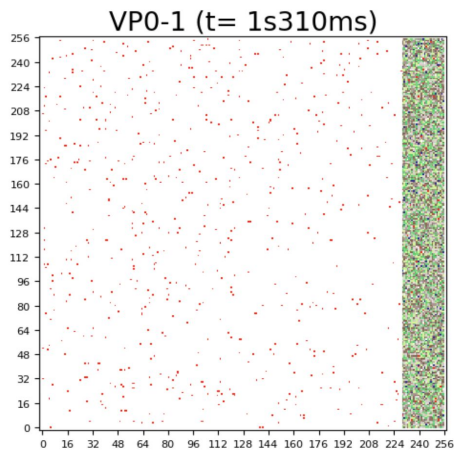

Nikhef VELO Meeting
 July 18th 2023

Maria Domenica Galati

We were here:

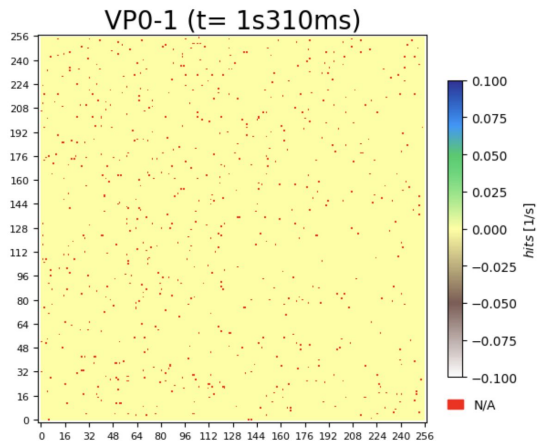

Looking at the single acquisitions at a low threshold there are different cases:

Partially bad scan

Completely bad scan

No hits

Good scan

0 hits when the DAC settings are all zeros (not clear why this happens)

```
smiSM_FE:2023.06.29 14:53:12.812 - <MODULE0::MODULE0> in state <NOT_READY>
smiSM_FE:2023.06.29 14:53:12.812 - <FE> in state <NOT_READY>
smiSM_Module0:2023.06.29 14:53:12.960 - <MODULE0_OPB> in state <NOT_READY>
WCCOAui3:2023.06.29 14:53:12.957["/home/velo/Velo_Minidaq/wincc/Velo_FSM/dim_writer/dim_decoding_tot
WCCOAui3:["settings = 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0"]
WCCOAui3:2023.06.29 14:53:13.791["Threshold: 1425, shutter: 1s310ms, Acquisition n. 5"]
WCCOAui3:2023.06.29 14:53:22.189["/home/velo/Velo_Minidaq/wincc/Velo_FSM/dim_writer/dim_decoding_tot
WCCOAui3:2023.06.29 14:53:22.920["Threshold: 1425, shutter: 1s310ms, Acquisition n. 6"]
WCCOAui5:2023.06.29 14:53:29.255["Param panel"]["velo:DAQ_Domain_VELO"]["NOT_READY"]["Configure"]["M
WCCOAui5:      1: "int PART ID = 0"
```

These scans can be cut out because also the masked pixels record 0 hits.

Bad scans always have the same mean number of hits in the 32th column of the ASIC:

```
Analyzing thr = 1550
Check thr = 1550, acq = 1 -> nhits = 13.5408124851, means[-1] = 17.0341796875

```

Before

VP0-1

After

VP0-1

VP3-1

Conclusions

- Position of noise peak changes from VP0-1 to VP3-1
- These data will be used as reference for the scans with the source
- Need cooling to take again the scan (I didn't upload the equalization ((((:)
