Testing the SM using B meson decays

- Decays of B mesons are great channels to probe the SM for New Physics (NP)
- We look at $B^0 \rightarrow K^{*0} e e$
- This is a **very rare** decay!
BR of $\sim 1.03 \times 10^{-6}$!

Branching Ratios

Angular coefficients

Testing the SM using B meson decays

- Decays of B mesons are great channels to probe the SM for New Physics (NP)
- We look at $B^0 \rightarrow K^{*0} ee$
- This is a **very rare** decay!
BR of $\sim 1.03 \times 10^{-6}$!

Branching Ratios

Angular coefficients

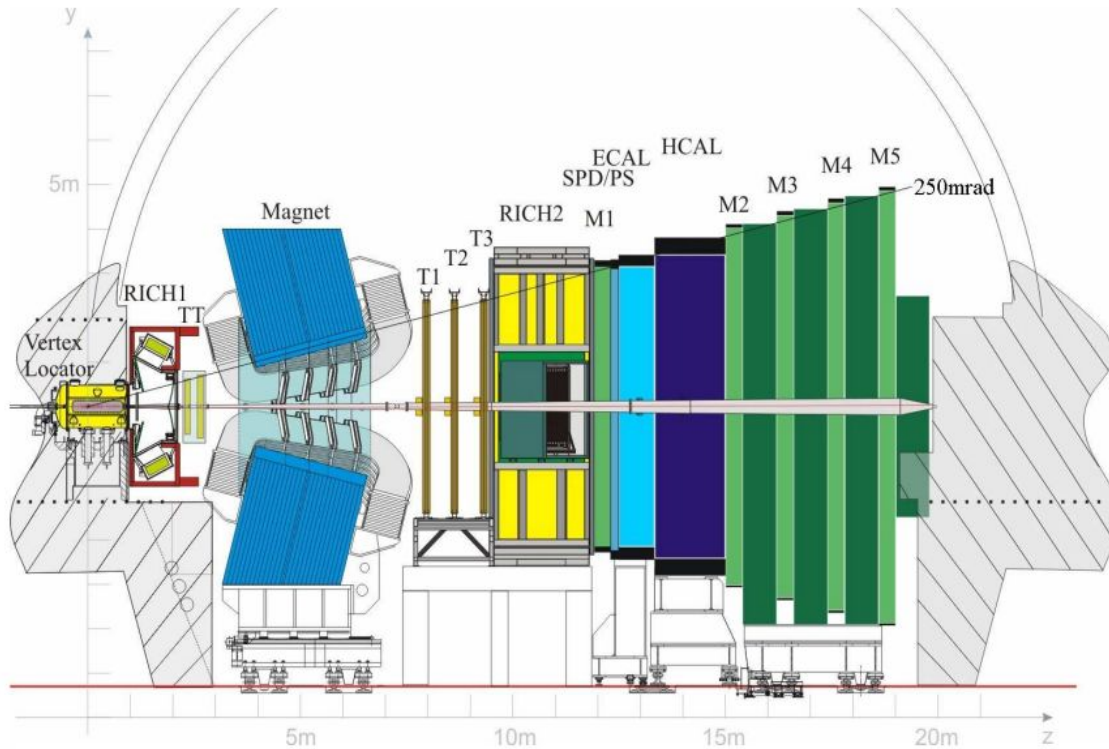

- Compare the SM predictions with the measurements
- Any discrepancies could be a sign of NP

Large Hadron Collider (LHC)

- 27 km circular particle accelerator at CERN
- Proton-proton collisions
- 4 beam collision points
 - ATLAS
 - ALICE
 - CMS
 - LHCb
- 2 data taking periods (Runs 1 & 2)
 - Run 3 ongoing

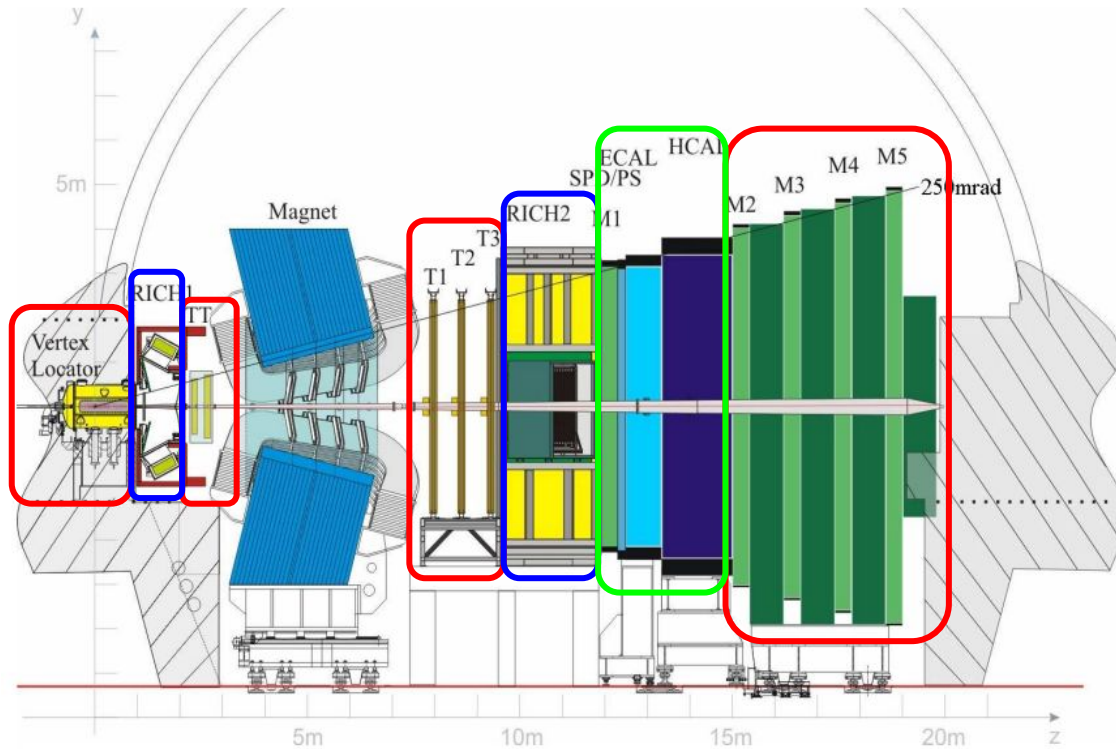

Large Hadron Collider beauty (LHCb)

- Beauty (bottom) quark dedicated experiment
- Composed of several subdetectors

Large Hadron Collider beauty (LHCb)

- Beauty (bottom) quark dedicated experiment
- Composed of several subdetectors

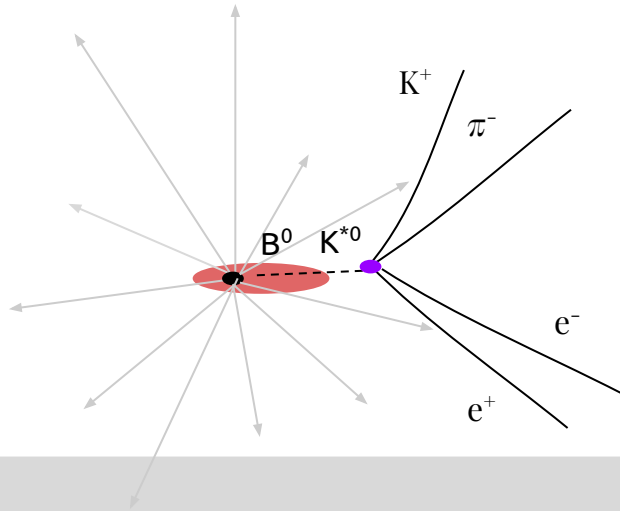

- Detect **position & momentum** of particle

- Measures **energy deposition**

- Particle **identification (PID)**

$B^0 \rightarrow K^{*0} ee$ topology

- K^{*0} is not stable and decays immediately to K and π
 - We're looking for $B^0 \rightarrow K^+ \pi^- e^+ e^-$
- q^2 is the di-electron invariant mass
- Data split up into different q^2 regions

Goal of the analysis

- The decay is described by $\theta_\ell, \theta_K, \phi$ and q^2

$$\frac{1}{d(\Gamma + \bar{\Gamma})/dq^2} \frac{d^4(\Gamma + \bar{\Gamma})}{dq^2 d\vec{\Omega}} = \frac{9}{32\pi} \left[\begin{aligned} & \frac{3}{4}(1 - F_L) \sin^2 \theta_K + F_L \cos^2 \theta_K \\ & + \frac{1}{4}(1 - F_L) \sin^2 \theta_K \cos 2\theta_\ell \\ & - F_L \cos^2 \theta_K \cos 2\theta_\ell + S_3 \sin^2 \theta_K \sin^2 \theta_\ell \cos 2\phi \\ & + S_4 \sin 2\theta_K \sin 2\theta_\ell \cos \phi + S_5 \sin 2\theta_K \sin \theta_\ell \cos \phi \\ & + \frac{4}{3} A_{FB} \sin^2 \theta_K \cos \theta_\ell + S_7 \sin 2\theta_K \sin \theta_\ell \sin \phi \\ & + S_8 \sin 2\theta_K \sin 2\theta_\ell \sin \phi + S_9 \sin^2 \theta_K \sin^2 \theta_\ell \sin 2\phi \end{aligned} \right]$$

Goal of the analysis

- The decay is described by $\theta_\ell, \theta_K, \phi$ and q^2

$$\frac{1}{d(\Gamma + \bar{\Gamma})/dq^2} \frac{d^4(\Gamma + \bar{\Gamma})}{dq^2 d\vec{\Omega}} = \frac{9}{32\pi} \left[\frac{3}{4}(1 - F_L) \sin^2 \theta_K + F_L \cos^2 \theta_K \right. \\ \left. + \frac{1}{4}(1 - F_L) \sin^2 \theta_K \cos 2\theta_\ell \right. \\ \left. - \boxed{F_L} \cos^2 \theta_K \cos 2\theta_\ell + \boxed{S_3} \sin^2 \theta_K \sin^2 \theta_\ell \cos 2\phi \right. \\ \left. + \boxed{S_4} \sin 2\theta_K \sin 2\theta_\ell \cos \phi + \boxed{S_5} \sin 2\theta_K \sin \theta_\ell \cos \phi \right. \\ \left. + \frac{4}{3} \boxed{A_{FB}} \sin^2 \theta_K \cos \theta_\ell + \boxed{S_7} \sin 2\theta_K \sin \theta_\ell \sin \phi \right. \\ \left. + \boxed{S_8} \sin 2\theta_K \sin 2\theta_\ell \sin \phi + \boxed{S_9} \sin^2 \theta_K \sin^2 \theta_\ell \sin 2\phi \right]$$

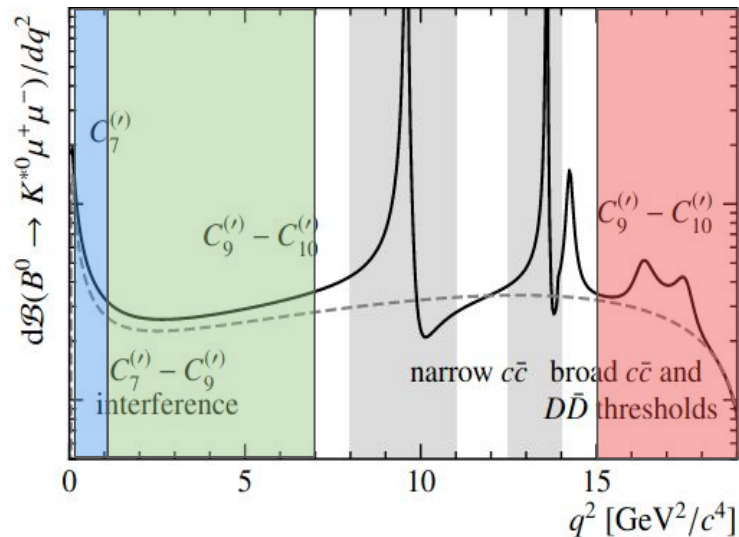

- Goal of the analysis:**
Measure the coefficients describing the angular distribution

- Compare with SM predictions
- Perform an angular fit
- Do this for each q^2 bin

Analysis strategy

- Run 1 and Run 2 LHCb data
 - Structured in nTuples
- Selection of data very important
 - **Separate signal from backgrounds**
- Analysis performed in bins of q^2
 - Low q^2 : $[0.1, 1] \text{ GeV}^2/c^4$
 - Center q^2 : $[1, 7] \text{ GeV}^2/c^4$
- Make use of **Monte Carlo (MC) simulations**

Workflow and production of nTuples

- Workflow
 - Perform corrections to MC
 - Selection of events
- Has some bottlenecks
 - Improve them!
 - Fix issues that come up
- Create nTuples!

Boosted Decision Trees (BDT)

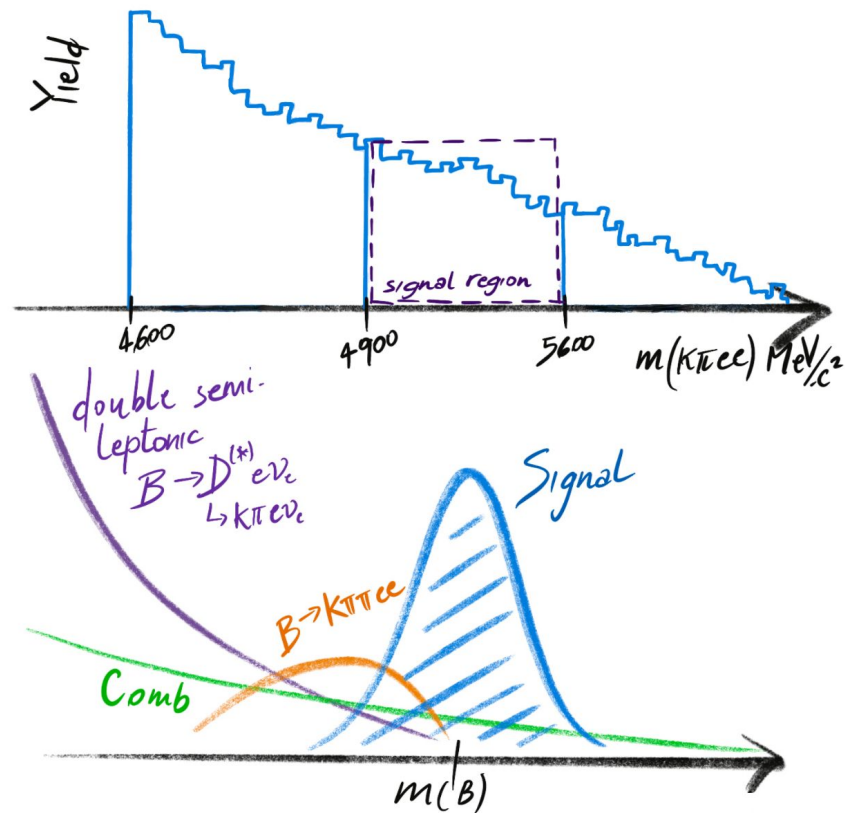

[Silvia Ferreres Solé](#)

- Machine Learning tool for **separating signal from background**
- Identifies patterns in features to predict signal
- Assigns a score to each event based on their 'signal-likeness'

BDT Goals

- Goal is to **reduce background** while **retaining signal**
- Train the BDT using training samples
 - MC signal
 - Lower and upper sidebands of data

BDT performance and overtraining

- BDT's performance is based on:
 - the features
 - the hyperparameters
 - the training samples

BDT performance and overtraining

- BDT's performance is based on:
 - the features
 - the hyperparameters
 - the training samples

- Particularly, we want to avoid **overtraining**

BDT performance and overtraining

- BDT's performance is based on:
 - the features
 - the hyperparameters
 - the training samples

- Particularly, we want to avoid **overtraining**

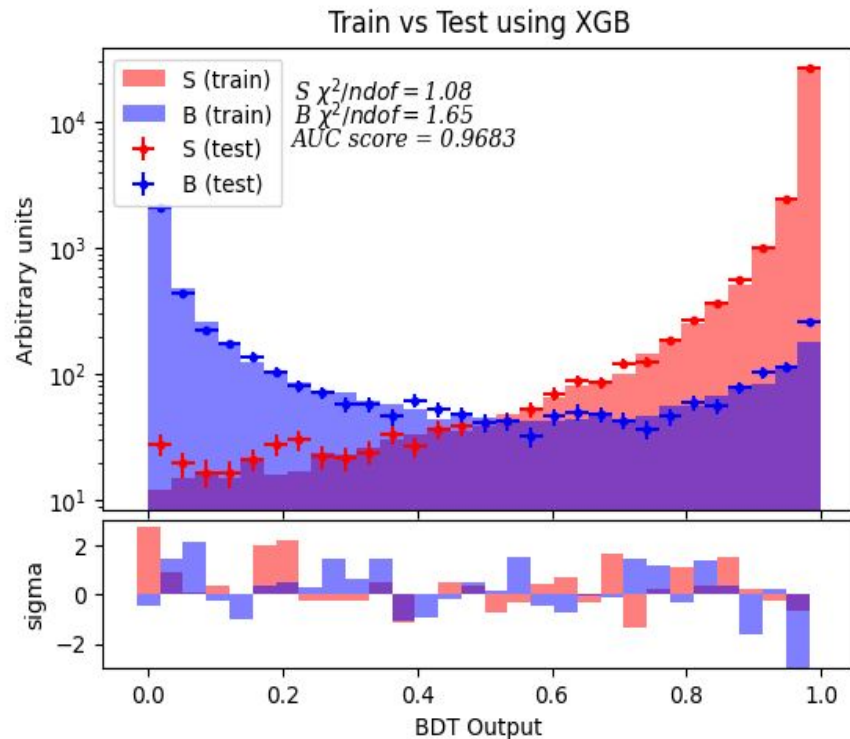

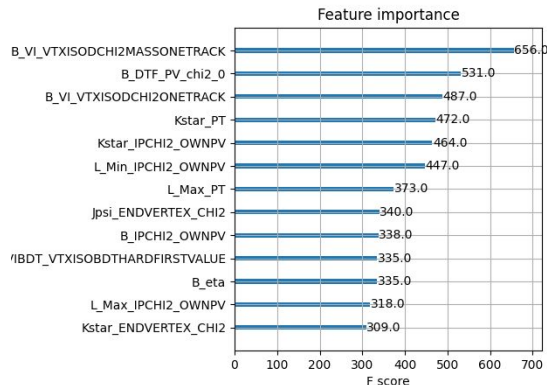

- Tuning the **hyperparameters**, target the BDT's **complexity**

Old BDT starting point

- Old BDT as starting point
- XGBoost from scikit library

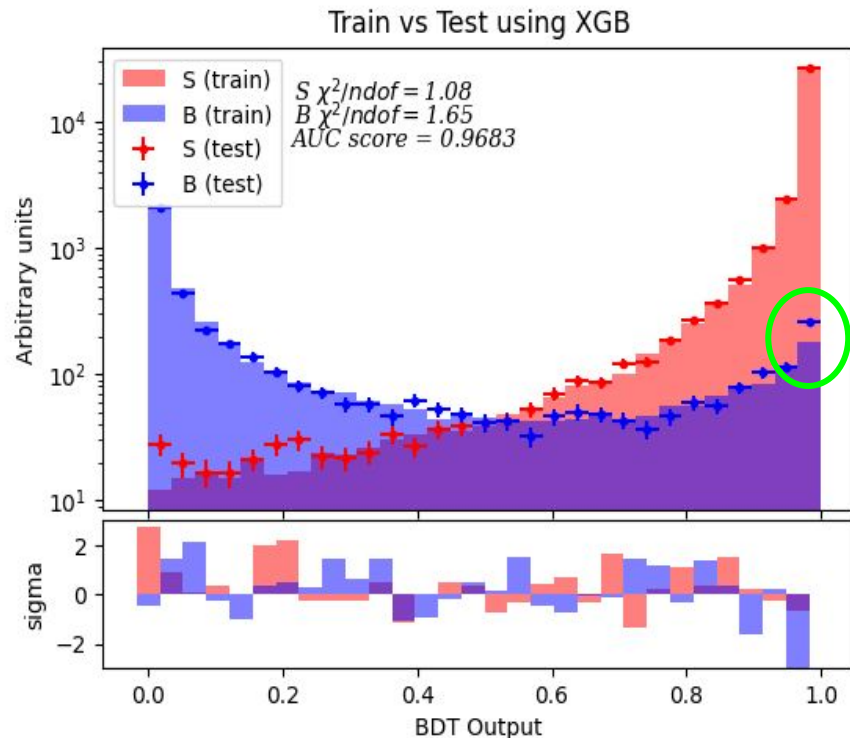

$n_estimators$ = 800
 max_depth = 3
 $learning_rate$ = 0.06
 $subsample$ = 0.5
 min_child_weight = 1

Old BDT starting point

- Old BDT as starting point
- XGBoost from scikit library
- We spot **overtraining!**

$n_estimators$ = 800
 max_depth = 3
 $learning_rate$ = 0.06
 $subsample$ = 0.5
 min_child_weight = 1

Optimizing BDT

- We tune hyperparameters
- Choose those that target the BDT's complexity
- Each combination of values gets assigned an AUC score

n_estimators
max_depth
learning_rate
subsample
min_child_weight

Optimizing BDT

- We tune hyperparameters
- Choose those that target the BDT's complexity
- Each combination of values gets assigned an AUC score
- Use `GridSearchCV` function to find the best combination given a range
 - Find the highest scoring combination!

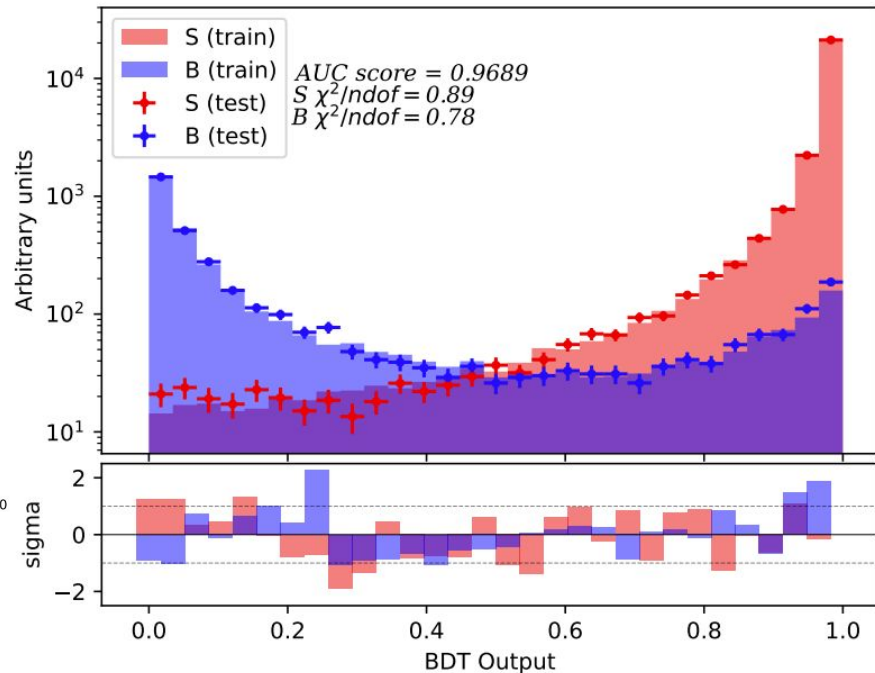

<code>n_estimators</code>	= 800	200
<code>max_depth</code>	= 3	4
<code>learning_rate</code>	= 0.06	0.05
<code>subsample</code>	= 0.5	0.5
<code>min_child_weight</code>	= 1	5

Optimized BDT in central q^2

$n_estimators$ = 200
 max_depth = 4
 $learning_rate$ = 0.05
 $subsample$ = 0.5
 min_child_weight = 5

BDT for low q^2

- Now we want the same, but for the low q^2 bin
- But, before starting from scratch we check how the central q^2 BDT performs here

BDT for low q^2

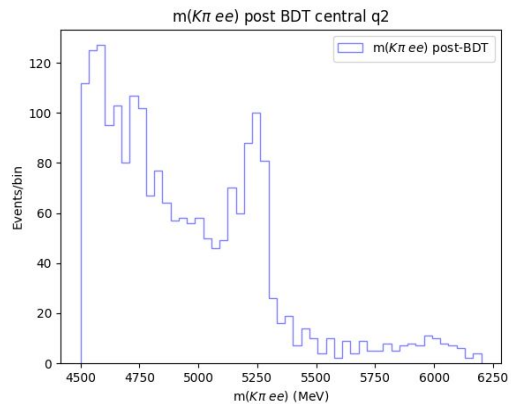

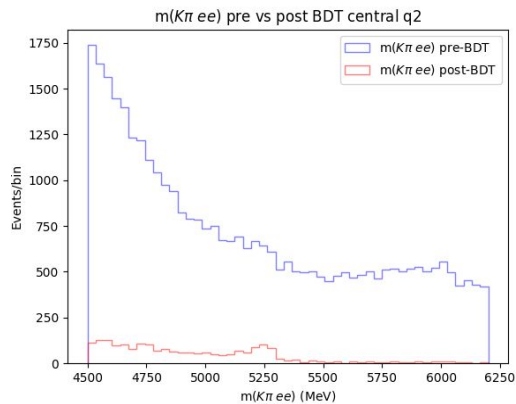

- Now we want the same, but for the low q^2 bin
- But, before starting from scratch we check how the central q^2 BDT performs here

Retention	central q^2	low q^2
Signal	0.883 ± 0.002	0.880 ± 0.002
Combinatorial	0.0212 ± 0.002	0.0212 ± 0.002
Partially Reconstructed	0.702 ± 0.012	0.712 ± 0.012

We can work with this!

B mass peak pre and post BDT

Central

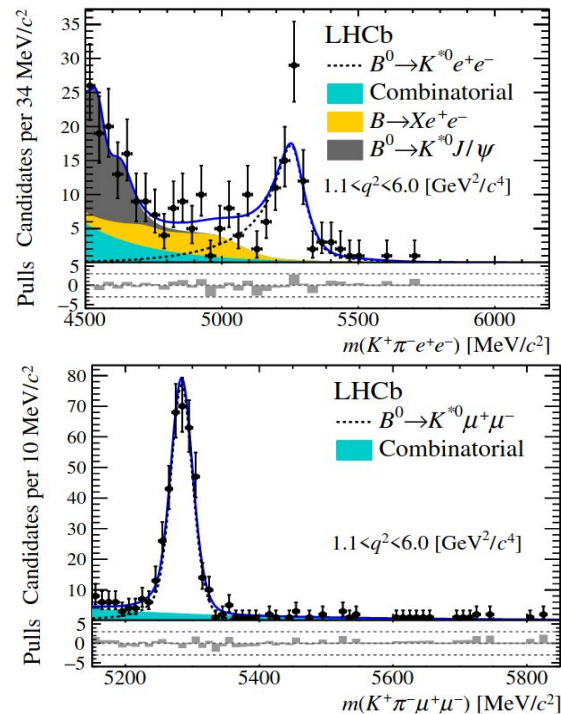

Low

Troubles with reconstruction of electrons

- Electron **Bremsstrahlung** 10^8 higher than muons!
- Worse mass resolution
- Worse reconstruction efficiency

JHEP 08 (2017) 055

Semileptonic background studies

- Semileptonic decays is one of the most common b quark decays
- It is a large background in our data
- We used to have a cut in place to deal with this, however ...

Semileptonic background studies

- Semileptonic decays is one of the most common b quark decays
- It is a large background in our data
- We used to have a cut in place to deal with this, however ...

[Nina Oskam 2023](#)

New cut for (some) semileptonic decays in central q^2

- New cut using brem 0 events and probability of electron being ...
 - Pion
 - Kaon
 - Proton

- More on this later...

Effects of new cut

Efficiency	MC
New cut	99.90%
Old cut	96.66%

Preliminary Mass Fit

- Making use of Likelihood function
- Using Minuit to minimize this to find best pdf

$$\mathcal{L}(\vec{x}_i, \vec{\theta}) = \prod_i f(\vec{\theta}|\vec{x}_i)$$

$$-\ln \mathcal{L}(\vec{x}_i, \vec{\theta}) = -\sum_i \ln f(\vec{\theta}|\vec{x}_i)$$

Preliminary Mass Fit

- Data signal
- Combinatorial
- Partially Reconstructed

MC Signal Fits

Brem 0

Brem 1

Brem 2

MC Generator Level Decay Angles

MC Angular Fit w/ Acceptance

Comparison effects of cut in ctl on angular coefficients

Outlook for semileptonic backgrounds

- Target SL decays below $m(K^+e^-) < 2000 \text{ MeV}^2/c^4$
- Peak in high $\cos \theta_\ell$
- Use the χ^2 on the electron vertex

$$B^0 \rightarrow (D^- \rightarrow (K^* \rightarrow K^+\pi^-)\pi^-)e^+\nu_e$$

$$B^0 \rightarrow (D^* \rightarrow (\bar{D} \rightarrow K^+\pi^-)\pi^-)e^+\nu_e$$

$$B^0 \rightarrow (D^- \rightarrow (K^* \rightarrow K^+\pi^-)e^-\bar{\nu}_e)e^+\nu_e$$

Conclusion

- Provided contributions to the collaboration
 - Optimizing steps in workflow
 - Creation of nTuples
- Improved the BDT by optimizing hyperparameters
 - Both central and low q^2
- Replaced a cut on semileptonic decays
 - To be used as a starting point
- Provided a preliminary mass and angular fit
 - Mass fit on data
 - Angular fit on MC

BACK UP SLIDES

Decay angles definitions

$\theta_l \rightarrow$ between the direction of the e^+ and the direction opposite to that of the B^0 in the rest frame of the dimuon system

$\theta_K \rightarrow$ between the direction of the K^+ and the direction of the B^0 in the rest frame of the K^{*0}

$\phi \rightarrow$ between the plane defined by the electrons pair and the plane defined by the kaon and pion in the B^0 rest frame

Wilson coefficients

- The operator C7 describes the radiative decay $b \rightarrow s\gamma$
- The operators C9 and C10 both describe the $b \rightarrow q\ell\ell$ transition. C9 corresponds to the vector current, and C10 to the axial current
- Finally, C10 describes the $B \rightarrow \ell^+\ell^-$ decays (in the SM)

Semileptonic backgrounds

Outlook cuts after BDT

Hyperparameter definitions

- `n_estimator`: amount of trees or rounds in the model
- `max_depth`: maximum depth of a tree
- `learning_rate`: step size shrinkage
- `subsample`: ratio of training instance, selection of the training data
- `min_child_weight`: minimum sum of instance weight needed in a child
