Active Learning for Gravitational Wave modelling

Tuesday, 30 April 2024 13:42 (20 minutes)

As a new era of gravitational wave detections rapidly unfolds, the importance of having accurate models for their signals becomes increasingly important.

The best model for gravitational waves are the fully-fledged simulations of General Relativity, although their daunting cost make it prohibitive to perform data analysis. To alleviate this, the community has developed a variety of approximate models, which upon calibration from the detailed simulations are accurate and fast to evaluate.

This program requires the exploration of a large and complex parameter space with expensive simulations. We will argue that Active Learning, a data-driven strategy to explore parameter space with costly experiments, is particularly relevant in this scenario reducing computational cost, time and human bias.

This talk will be partly based on <https://arxiv.org/abs/2311.11311>
