

If charm lose energy in QGP the  $p_T$ -dependent yield of D mesons should be modified going to Pb-Pb (from pp)

$$R_{AA} = \frac{\sigma_{\text{inel}}}{\langle N_{\text{coll}} \rangle} \frac{d^2 N_{AA}/dydp_T}{d^2 \sigma_{pp}/dydp_T} =$$

If no QGP  $R_{AA}$  should be one ... with several caveats: parton spectra, fragmentation, ....
