

Future Collider scenarios

a brief introduction to inform the discussion

Jorgen D'Hondt

Ambition for particle physics & collider options at CERN

- **Discoveries at the highest energies**

→ 10 TeV parton-scale energy

- hadron collider, muon collider, plasma-based collider
 - FCC-hh ~100 TeV
 - μ -collider @ 3 or 10 TeV
 - *LC e^+e^- @ 10 TeV*

- **Discoveries through precision & high intensity**

→ energy scales up to 1 TeV

- e^+e^- linear or circular collider, electron-hadron collider
 - FCC-ee 90-365 GeV
 - LCF 250-550 GeV
 - CLIC 380-1500 GeV
 - LEP3 90-230 GeV
 - LHeC 1200 GeV

Flavia

- **Discoveries at the highest energies**

→ 10 TeV parton-scale energy

- hadron collider, muon collider, plasma-based collider
 - FCC-hh ~100 TeV
 - μ -collider @ 3 or 10 TeV
 - *LC e^+e^- @ 10 TeV*

directly to high- Λ

- **Discoveries through precision & high intensity**

→ energy scales up to 1 TeV

- e^+e^- linear or circular collider, electron-hadron collider
 - FCC-ee 90-365 GeV
 - LCF 250-550 GeV
 - CLIC 380-1500 GeV
 - LEP3 90-230 GeV
 - LHeC 1200 GeV

indirectly to high- Λ

Technical timelines for each collider option at CERN

- **FCC-ee** – earliest 2048
- **FCC-hh** with 14T to 85TeV – earliest 2051-2055 (short model Nb₃Sn)
- **FCC-hh** with 20T to 120TeV – earliest 2070 (HTS)
- **LCF/ILC** SCRF from 250GeV to 550GeV (29.5km) – earliest 2045
- **CLIC** NCRF from 380GeV to 1.5TeV (33.5km) – earliest 2045
- **MuColl** 7.6TeV – earliest 2048 (need an initial demonstrator project)
- **LEP3** after HL-LHC – earliest 2047
- **LHeC** after HL-LHC – earliest 2043

LHeC – baseline

LHeC – baseline high-lumi running in the 2040'ies

<https://indico.cern.ch/e/LHeCFCCeh>

802.5MHz, 20MV/m in CW, 6x25mA in SRF
 ERL 3-turns, **50 GeV** (1/3 of LHC circumference)
 Start operation after HL-LHC (>2041)
 Luminosity above $10^{34} \text{ cm}^{-2}\text{s}^{-1}$
6 years of operation, 1 ab^{-1} (e.g. 2043-2048)
 120MW from HL-LHC + 100MW from e-beam

one general purpose experiment

LHeC → LEP3@230

- LHeC and LEP3 have a comparable number of cryomodules and thus comparable 800 MHz power system and distribution lines, i.e. very similar industrial contracts and the LHeC developments can directly lead into LEP3 orders / productions.
 - clear synergies that can be exploited for common design and optimization, e.g. cryomodules, power sources, cryogenic systems, beam diagnostics, magnets
 - opportunity to leverage the synergies between the SRF developments for LHeC, LEP3 and FCCee into a joined effort
 - efficient (re-)use of new technologies and infrastructure

LHeC → LEP3@230

Two linacs of $\sim 1\text{ km}$ each in the LHeC each providing $\sim 10\text{ GeV}$ acceleration to the electrons.

- the electron beam operates at a high beam-power of $\sim 1\text{ GW}$
- requirement to recover the energy with the ERL method

LHeC \rightarrow LEP3@230

The current LEP3 design assumes an injection energy of 10 GeV which is equivalent to one of the LHeC linacs.

- one of the LHeC linacs can be the injector for LEP3

LHeC → LEP3@230

The current LEP3 design assumes an injection energy of 10 GeV which is equivalent to one of the LHeC linacs.

- one of the LHeC linacs can be the injector for LEP3

Using both LHeC linacs could easily increase the injection energy to 20 GeV, even without re-circulation.

- in re-circulation mode, the LHeC could even inject with direct top-up at the Z energy and possibility up to W production beam energies

LHeC → LEP3@230

One could use one of the LHeC tunnel straight sections for the installation of the LEP3 booster ring RF (1 km straight section → > 10 GeV potential for both electrons and positrons)

- one of the LHeC linacs as 10 GeV injector of electrons and positrons for LEP3
- one of the LHeC linacs can be used for the LEP3 booster

LHeC transfer line to LEP3

LHeC transfer line to LEP3

LHeC transfer line to LEP3

Cost of the combined LHeC + LEP3 scenario

- The capital investment for LHeC is ~2B CHF, standalone
- Most of this investment can be directly reused for the LEP3 injector
- The capital investment for LEP3 is ~4B CHF, standalone
- A significant part is for the SRF system and the injector
- Due to the synergies and the dual use, the combined capital investment for LHeC+LEP3 can be expected to be ~5B CHF

The combined LHeC + LEP3 scenario makes an interesting bridge to the FCChh:

1. FCChh starts ~2065: faster compared to FCCee route (independent tunnel ee vs pp),
2. Less expensive compared to FCCee (~5B CHF rather than ~10B CHF),
3. Brings interesting physics and flexibility to adapt (e.g. balancing pp/ep/ee runs, alternative high-energy options like the muon collider),
4. At all times, avoids long gaps between colliders at CERN.

Summary: SRF synergies & options to combine LHeC+LEP3

- The combined LHeC + LEP3 scenario provides excellent physics for a broad range of topics (QCD, EW, top, Higgs, BSM, flavour) and in the search for deviations from the SM the combination of pp+ep+ee physics allows to break degeneracies in global fits
- SRF developments for LHeC and LEP3 are synergistic, also with FCCee
- There is opportunity for a significant reuse of the LHeC capital investment in LEP3
- After the LHeC runs, the LEP3 injector will be fully commissioned from the start of the LEP3 run which would gain time to high performance which is essential for LEP3
- The final choice of the physics ep and ee runs can be decided in due time depending on the evolution of the science case

Strategy:

1. further the exploration & exploitation of the SRF synergies between FCCee, LHeC and LEP3, such that developments for FCCee can also be deployed for alternative options;
2. no choice required today among alternatives to FCC, only when it would not be feasible to implement the integrated FCC programme, the alternative routes to FCChh would be ready for a decision by ESPP2032 (i.e. LHeC-only, LEP3-only or combined LHeC+LEP3)
