CT scan

Schneider
approach

$$HU = 1000 \frac{\mu - \mu_{water}}{\mu_{water}}$$

3D map of Proton
Stopping Powers (PSP)

- Conversion HU to stopping power is NOT unique
- Systematic uncertainties of 3-4% or more require larger than necessary irradiation safety margins around the tumor

... And the consequence...

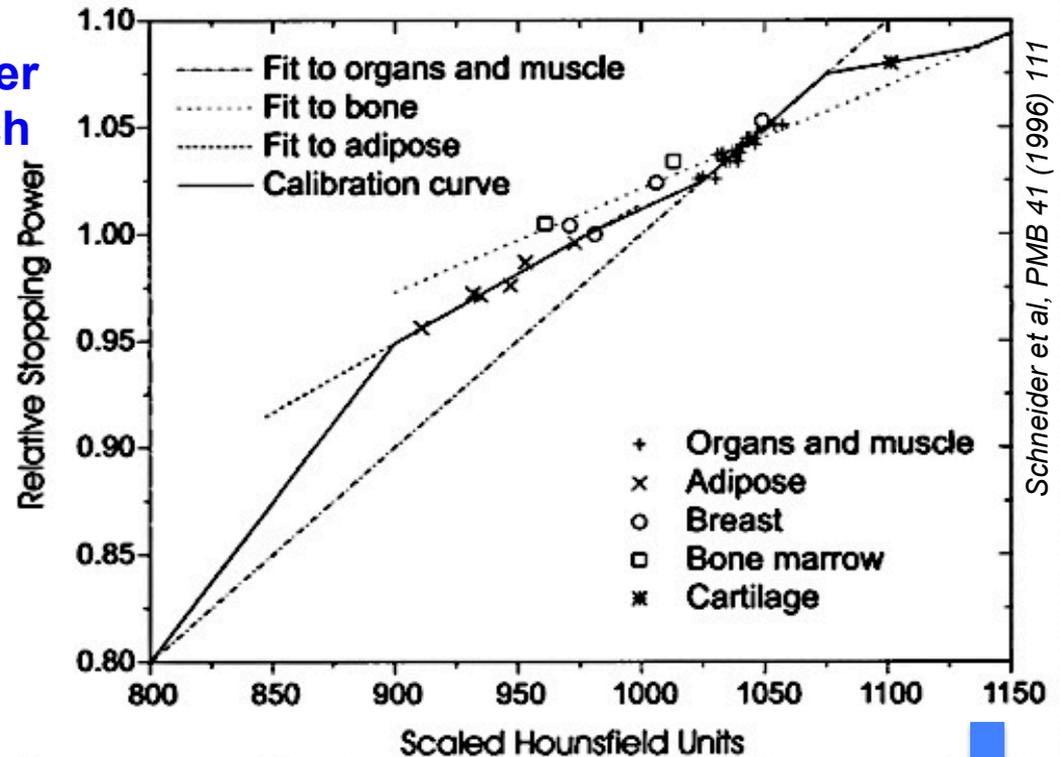

CT scan

Schneider
approach

$$HU = 1000 \frac{\mu - \mu_{water}}{\mu_{water}}$$

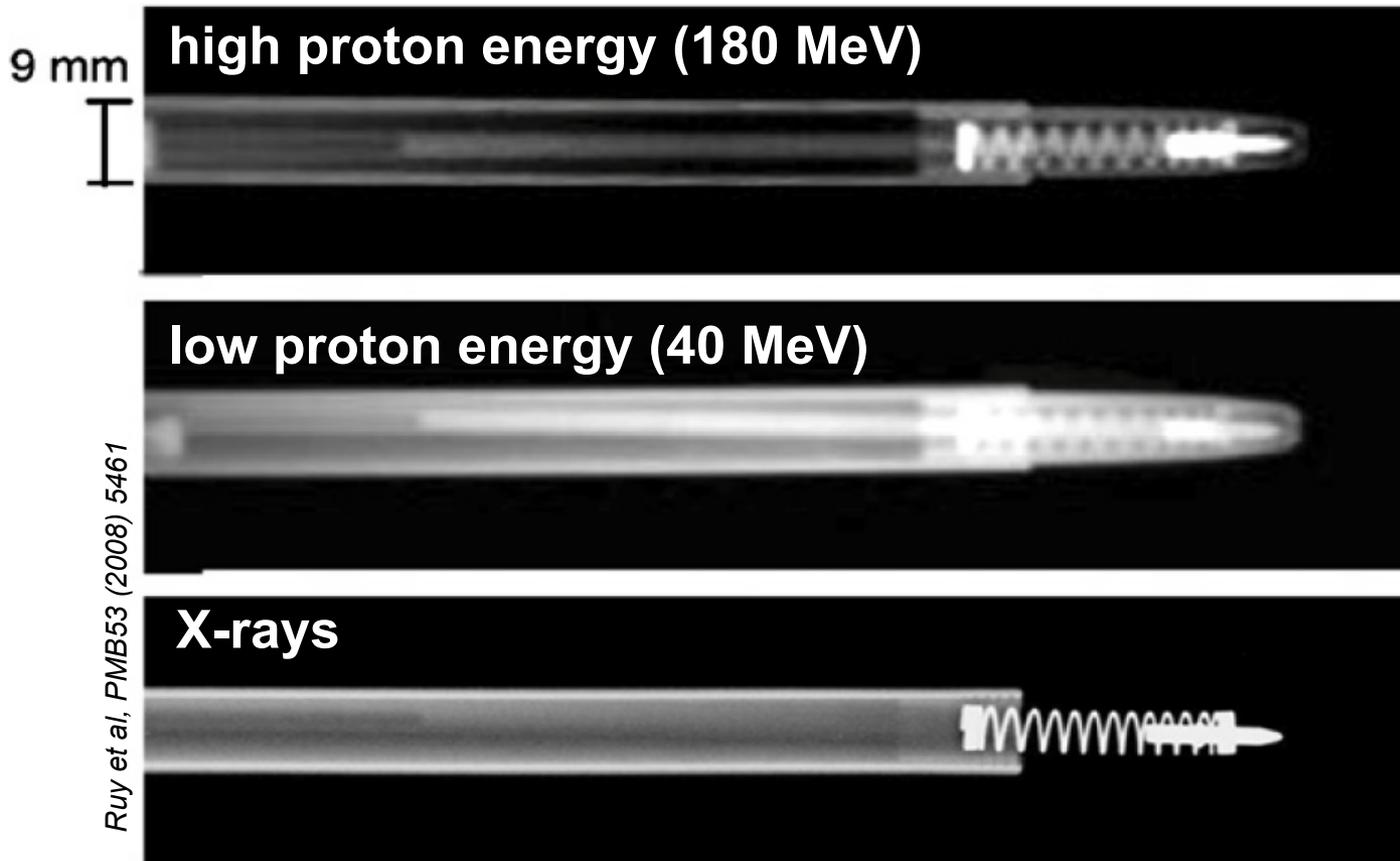

- Conversion HU to stopping power is NOT unique
- Systematic uncertainties of 3-4% or more require larger than necessary irradiation safety margins around the tumor

3D map of Proton Stopping Powers (PSP)

Leads to increased dose in healthy tissues

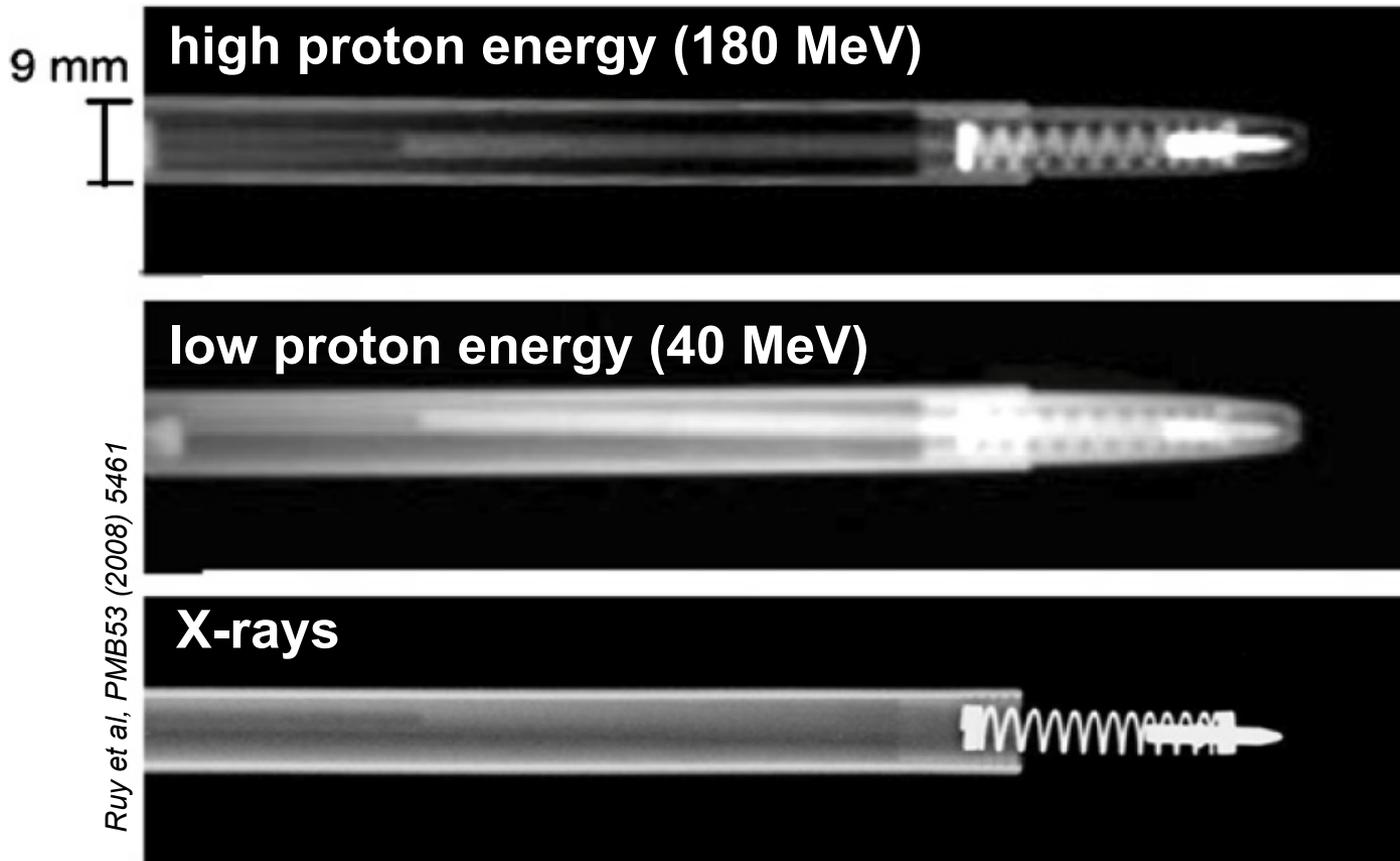

Why proton radiography?

- ✧ High resolving power for proton beam (centerpiece of the pen visible)
- ✧ X-ray produces a clearer image of the spring, but density resolution for the centerpiece is not high

Why proton radiography?

- ✧ High resolving power for proton beam (centerpiece of the pen visible)
- ✧ X-ray produces a clearer image of the spring, but density resolution for the centerpiece is not high

Protons
 help
 to improve
 determination
 of energy losses
 in “soft material”

What is proton radiography?

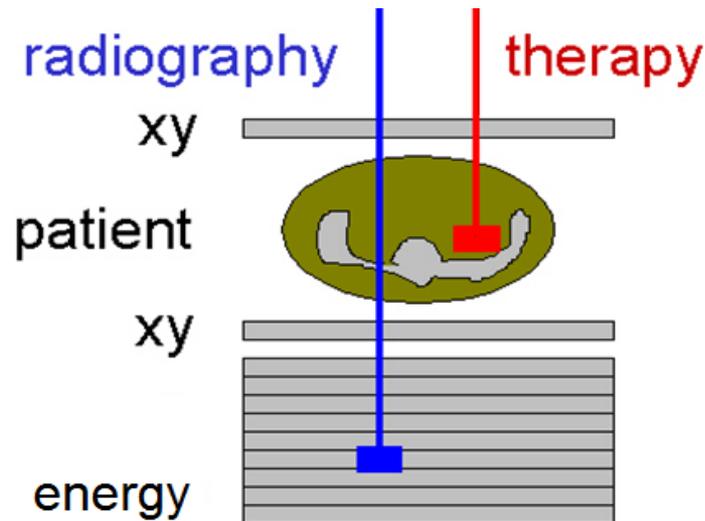

✧ Proton beam energy higher than the therapeutic energies,
i.e. protons pass through the patient

✧ Position detectors:

before and after the patient

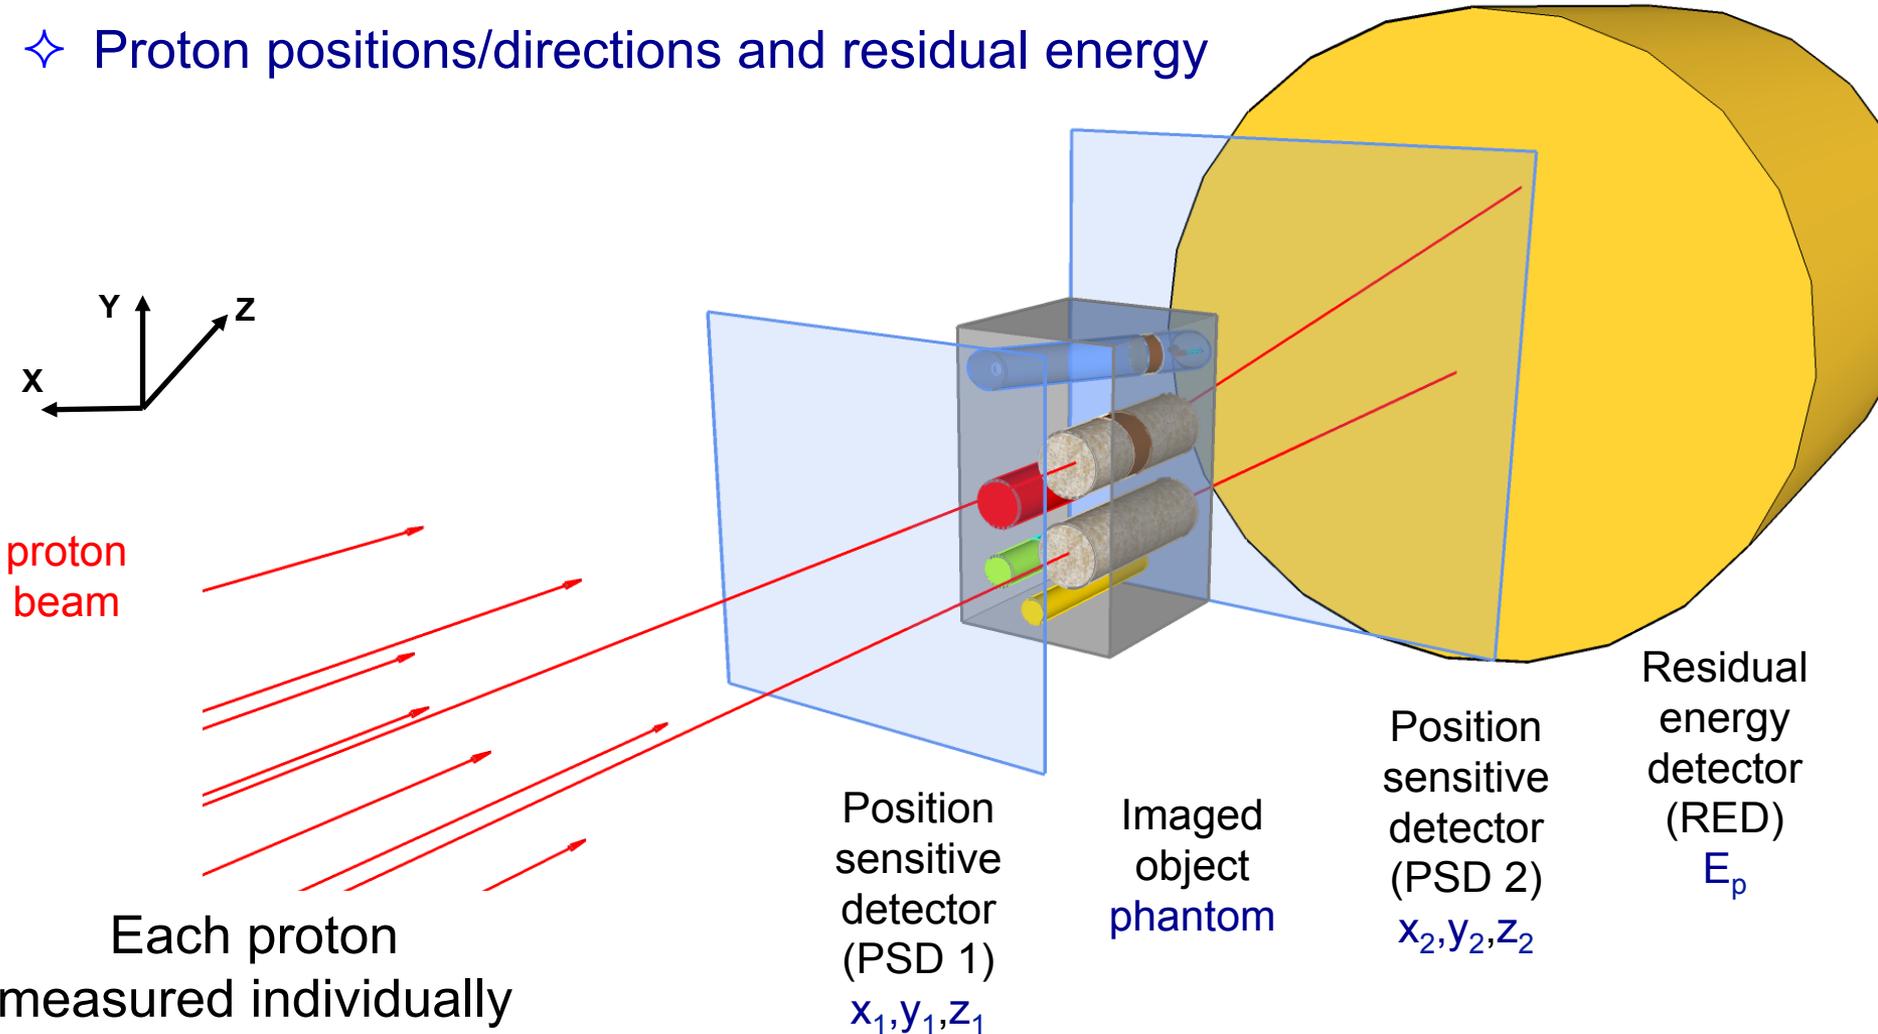

✧ Range / residual energy detector:

after the patient

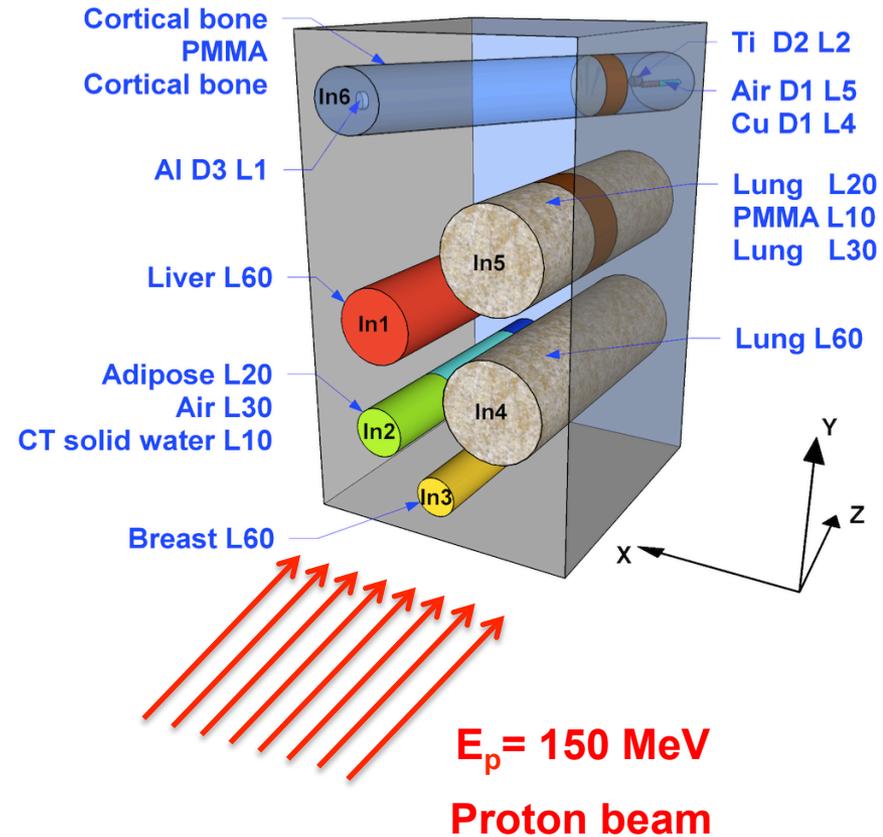

Proton radiography: Geant4 MC simulations

- ✧ $50 \cdot 10^6$ protons generated, scattered beam, $E_p = 150$ MeV
- ✧ Proton positions/directions and residual energy

Complex phantom (54 x 94 x 60 mm³)

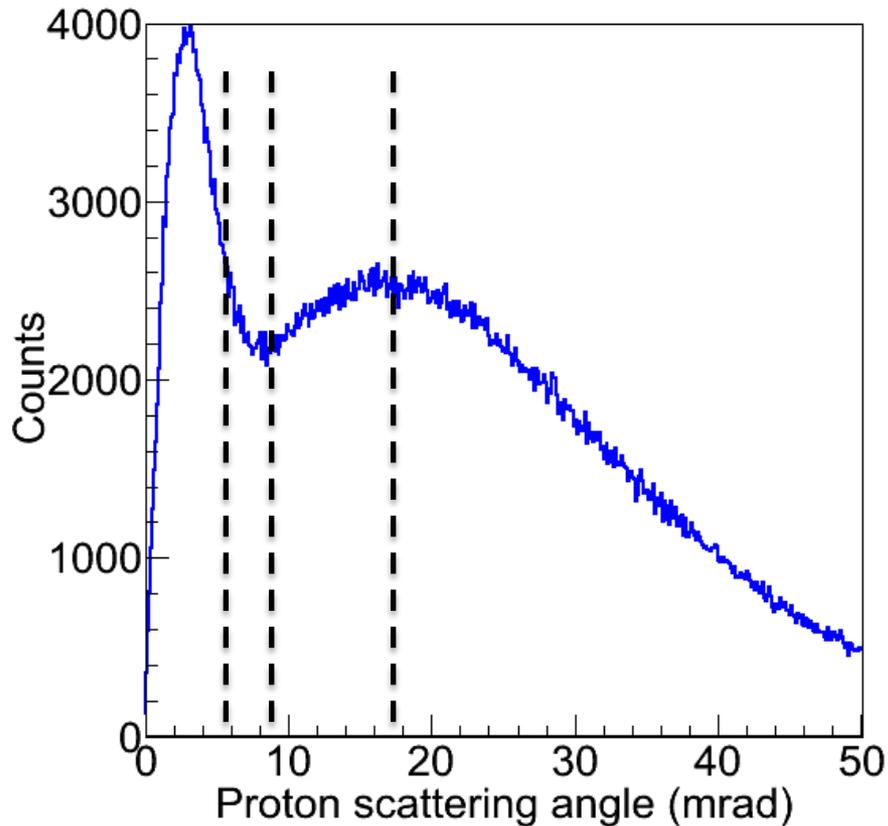

- ✧ Few materials on proton beam
- ✧ 11 various materials, including 5 tissue surrogates

Phantom material	Physical density (g/cm ³)	Phantom material	Physical density (g/cm ³)
Cortical bone*	1.820	Breast*	0.981
PMMA	1.180	Lung*	0.428
Liver*	1.095	Al	2.702
Adipose (fat)*	0.946	Ti	4.519
Air	0.0012	Cu	8.920
CT solid water	1.045	* Tissue-equivalent materials

Proton scattering angle, θ

$$\theta(rad) = \cos^{-1} \left(\frac{\vec{p}_0 \cdot \vec{p}_3}{|\vec{p}_0| |\vec{p}_3|} \right)$$

\vec{p}_0, \vec{p}_3 – proton momenta
in the source and energy
detector, respectively

Energy loss radiographs: $\Delta E = E_{\text{beam}} - E_{\text{residual}}$

- ✧ Protons that passed through all 3 detectors are considered

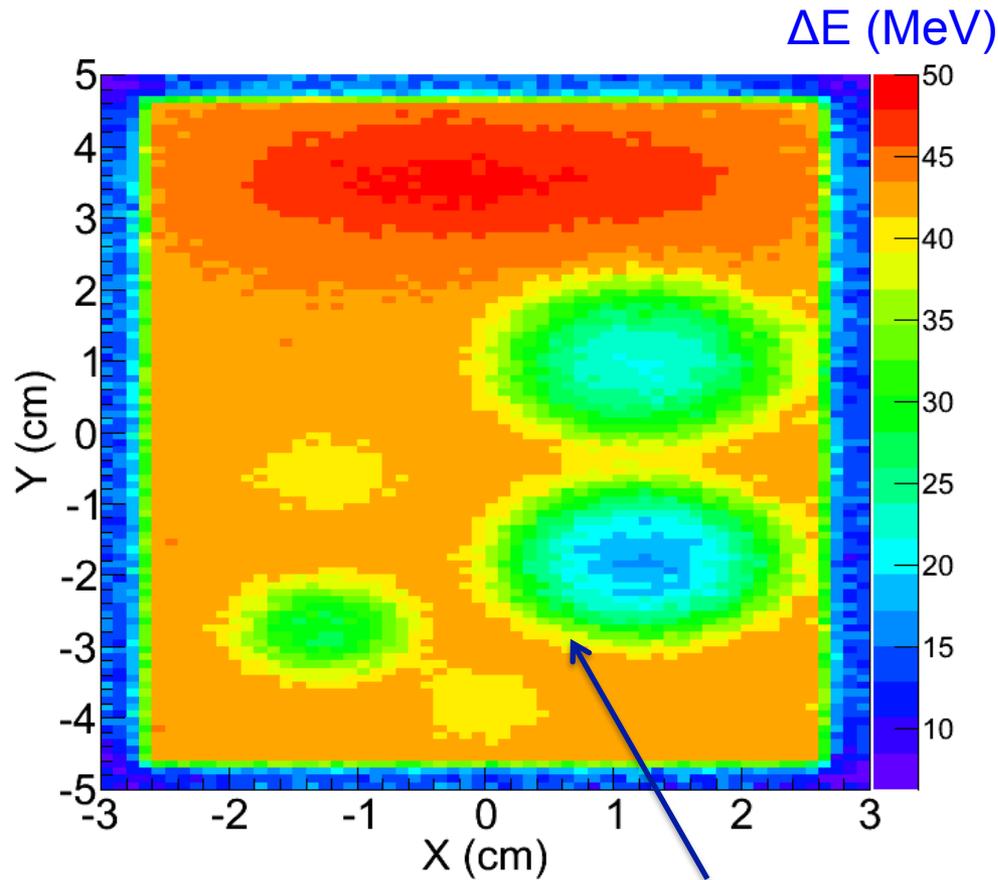

Image blurring

Geant4 simulations

Energy loss radiographs: $\Delta E = E_{\text{beam}} - E_{\text{residual}}$

✧ Protons that passed through all 3 detectors are considered

✧ Protons with maximum scattering angle $\theta < 5.2$ mrad

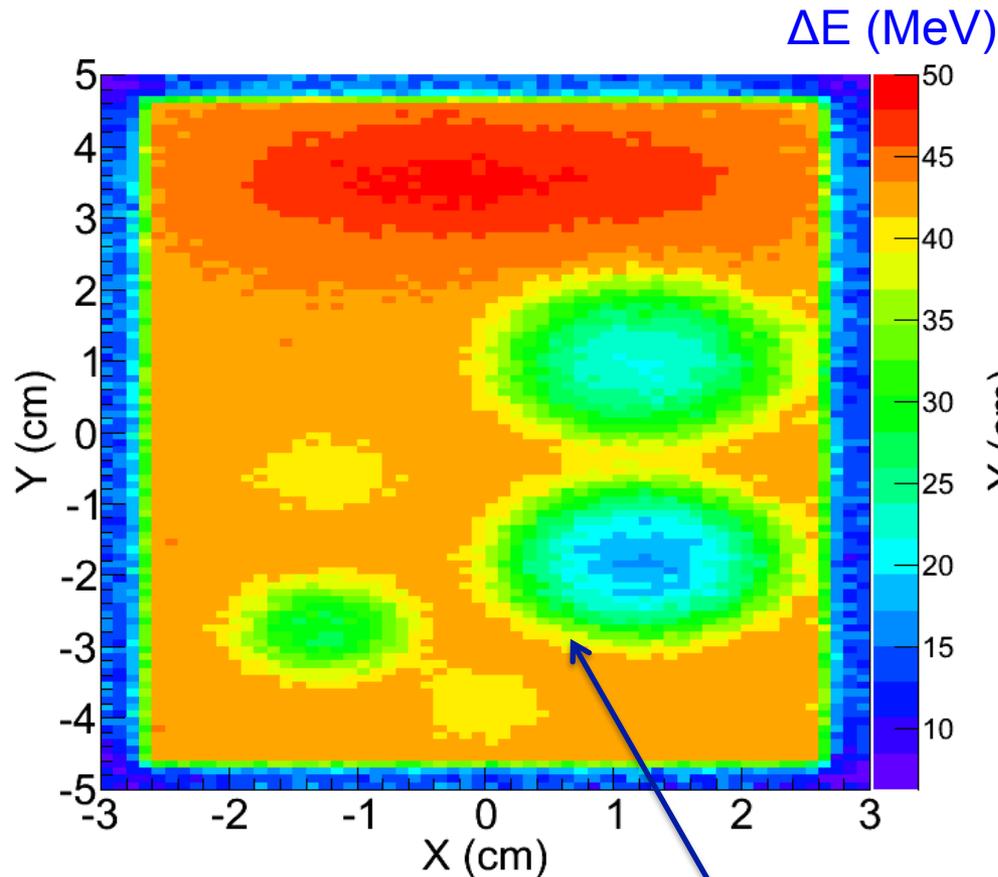

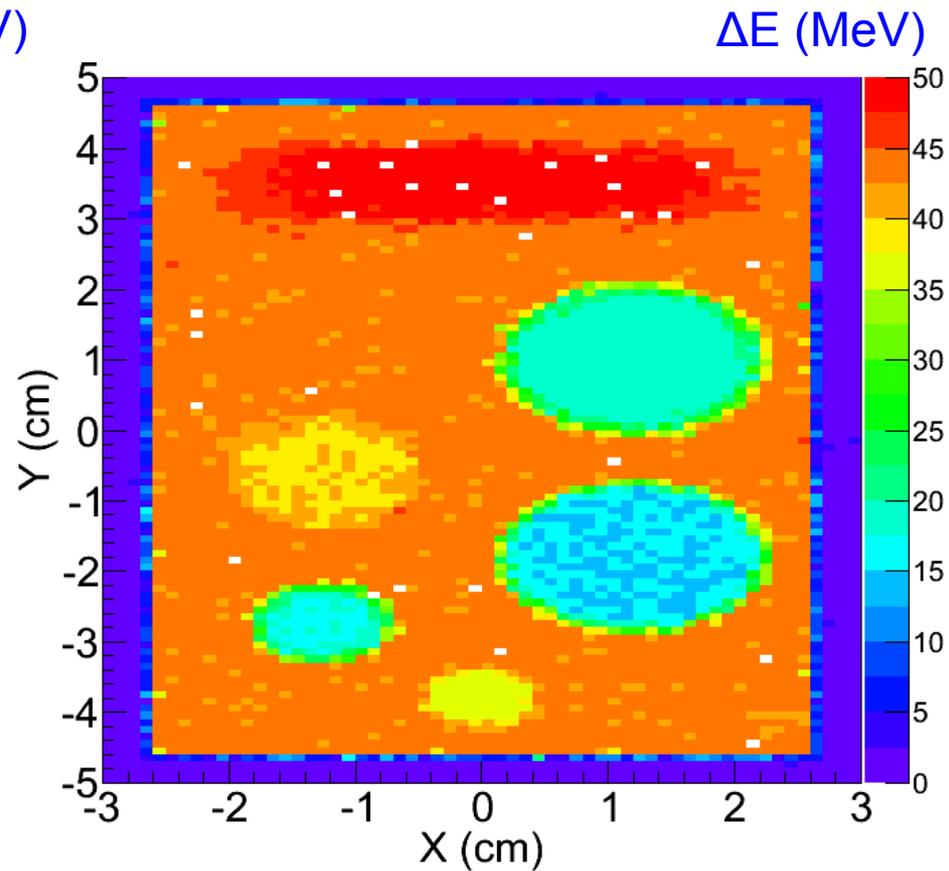

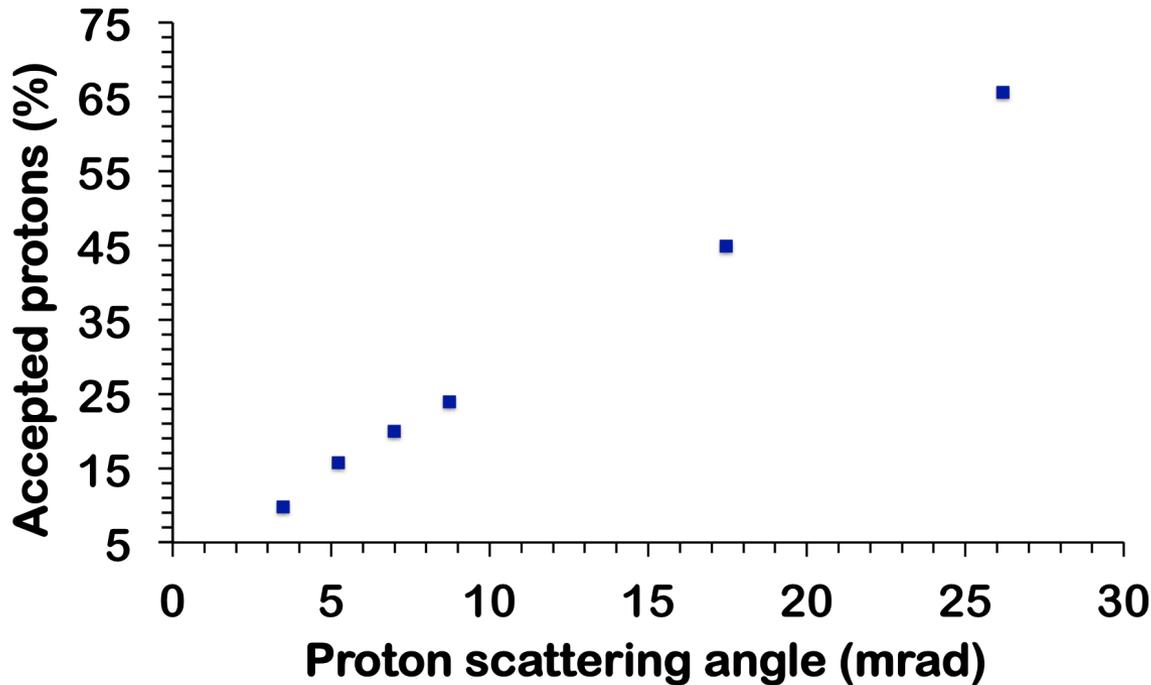

Image blurring

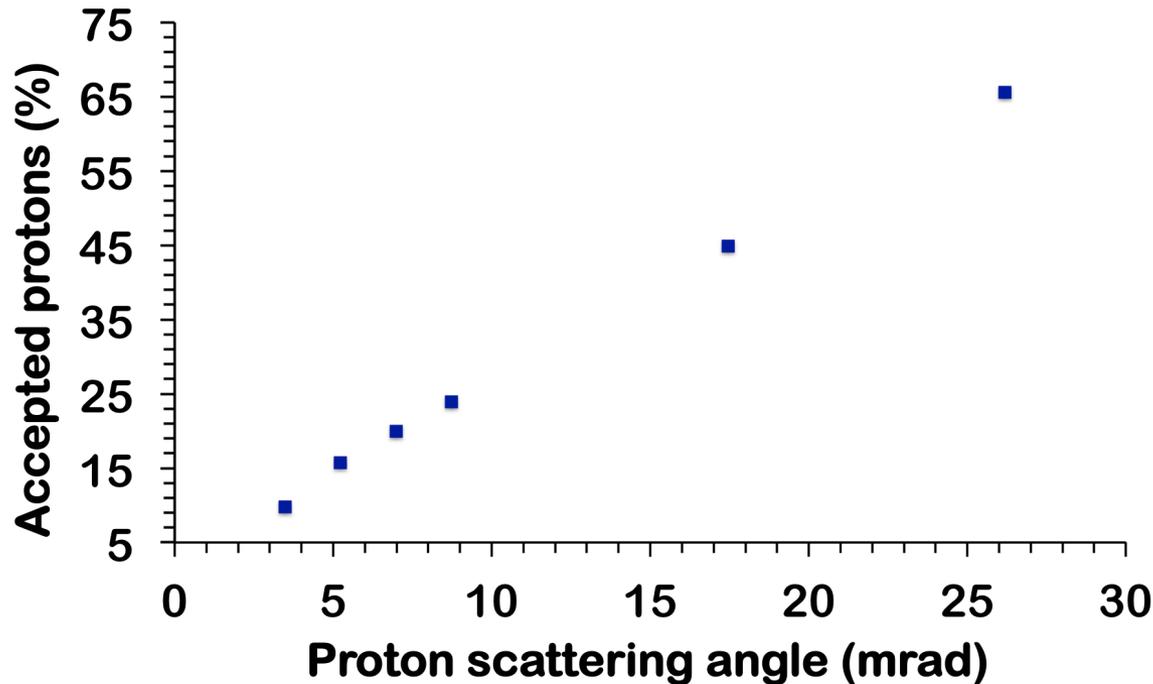

Geant4 simulations

Statistics @ $E_p = 150$ MeV

θ (mrad)	Accepted protons (%)
26.2	65.6
17.4	44.9
8.7	23.9
6.7	20.0
5.2	15.7
3.5	9.8

Statistics @ $E_p = 150$ MeV

θ (mrad)	Accepted protons (%)
26.2	65.6
17.4	44.9
8.7	23.9
6.7	20.0
5.2	15.7
3.5	9.8

Significant number of protons (>70%) simulated at $E_p=150$ MeV is eliminated at $\theta < 8.7$ mrad

Proton radiography @KVI-CART: Exp setup'15

Collaboration with J. Visser, M. van Beuzekom, E.N. Koffeman

✧ Tracking detectors:

- Timepix3-based TPC
- Count rate ~20 kHz

✧ Energy: BaF₂ scintillator

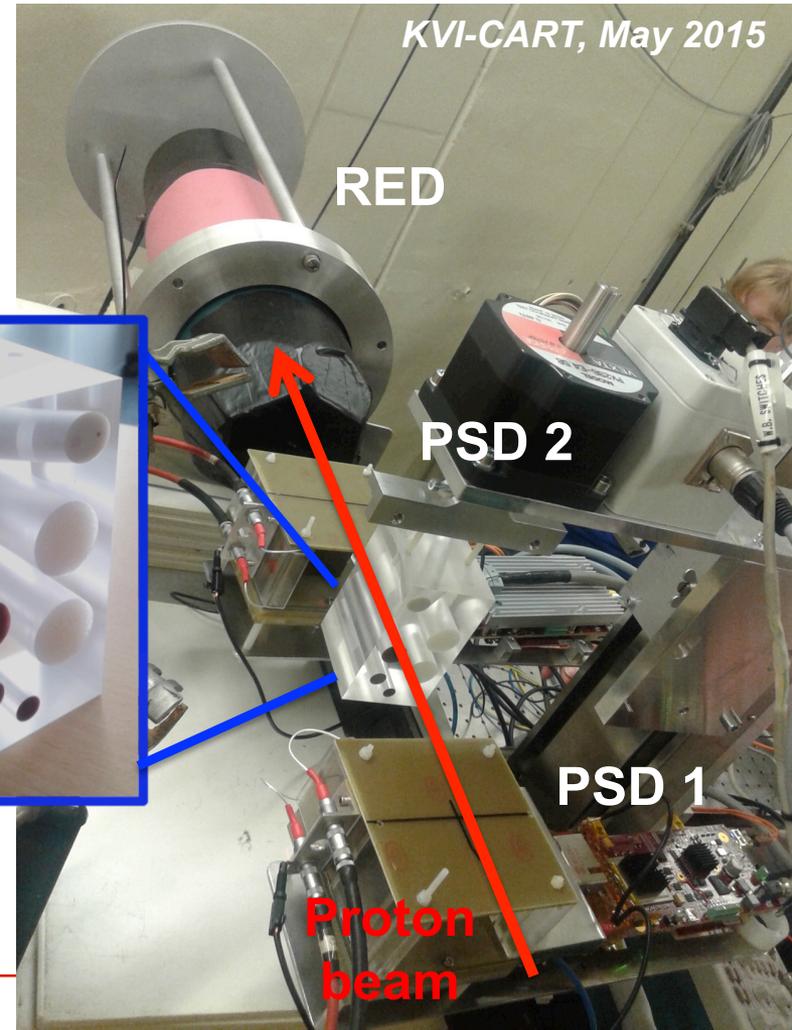

✧ Proton beam energy:

- $E_p = 150$ MeV

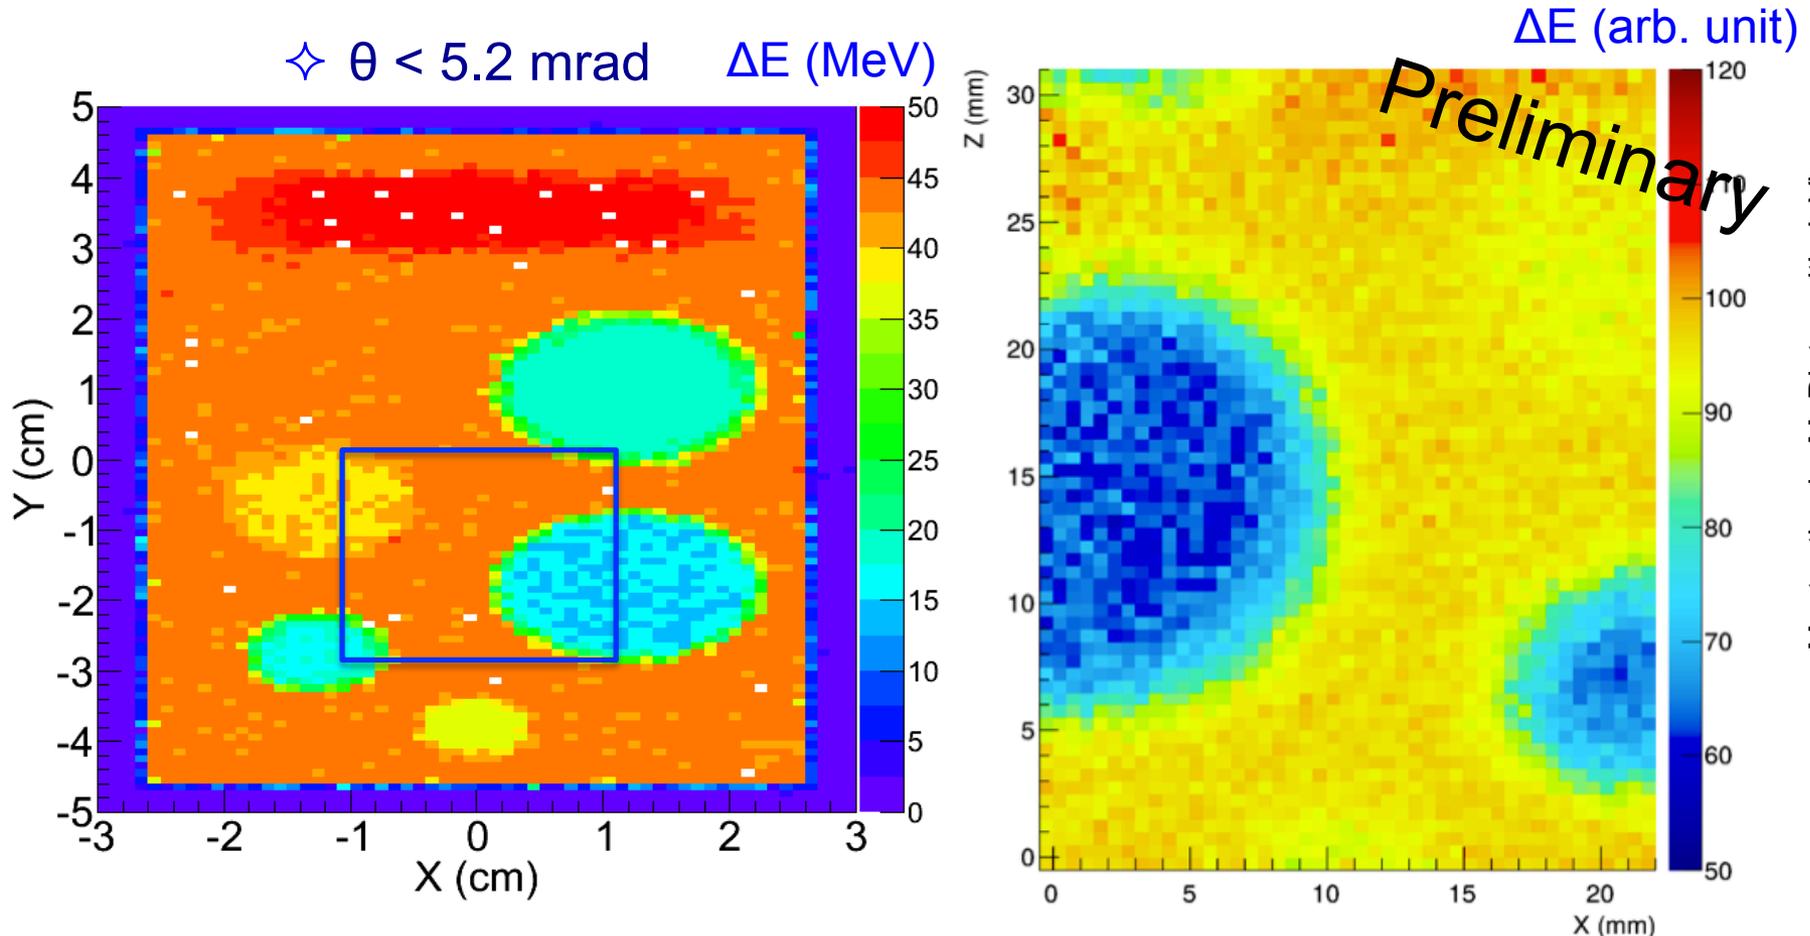

AGOR @KVI-CART
Groningen (NL)

Count rate not high enough
as required in clinics

Phantom

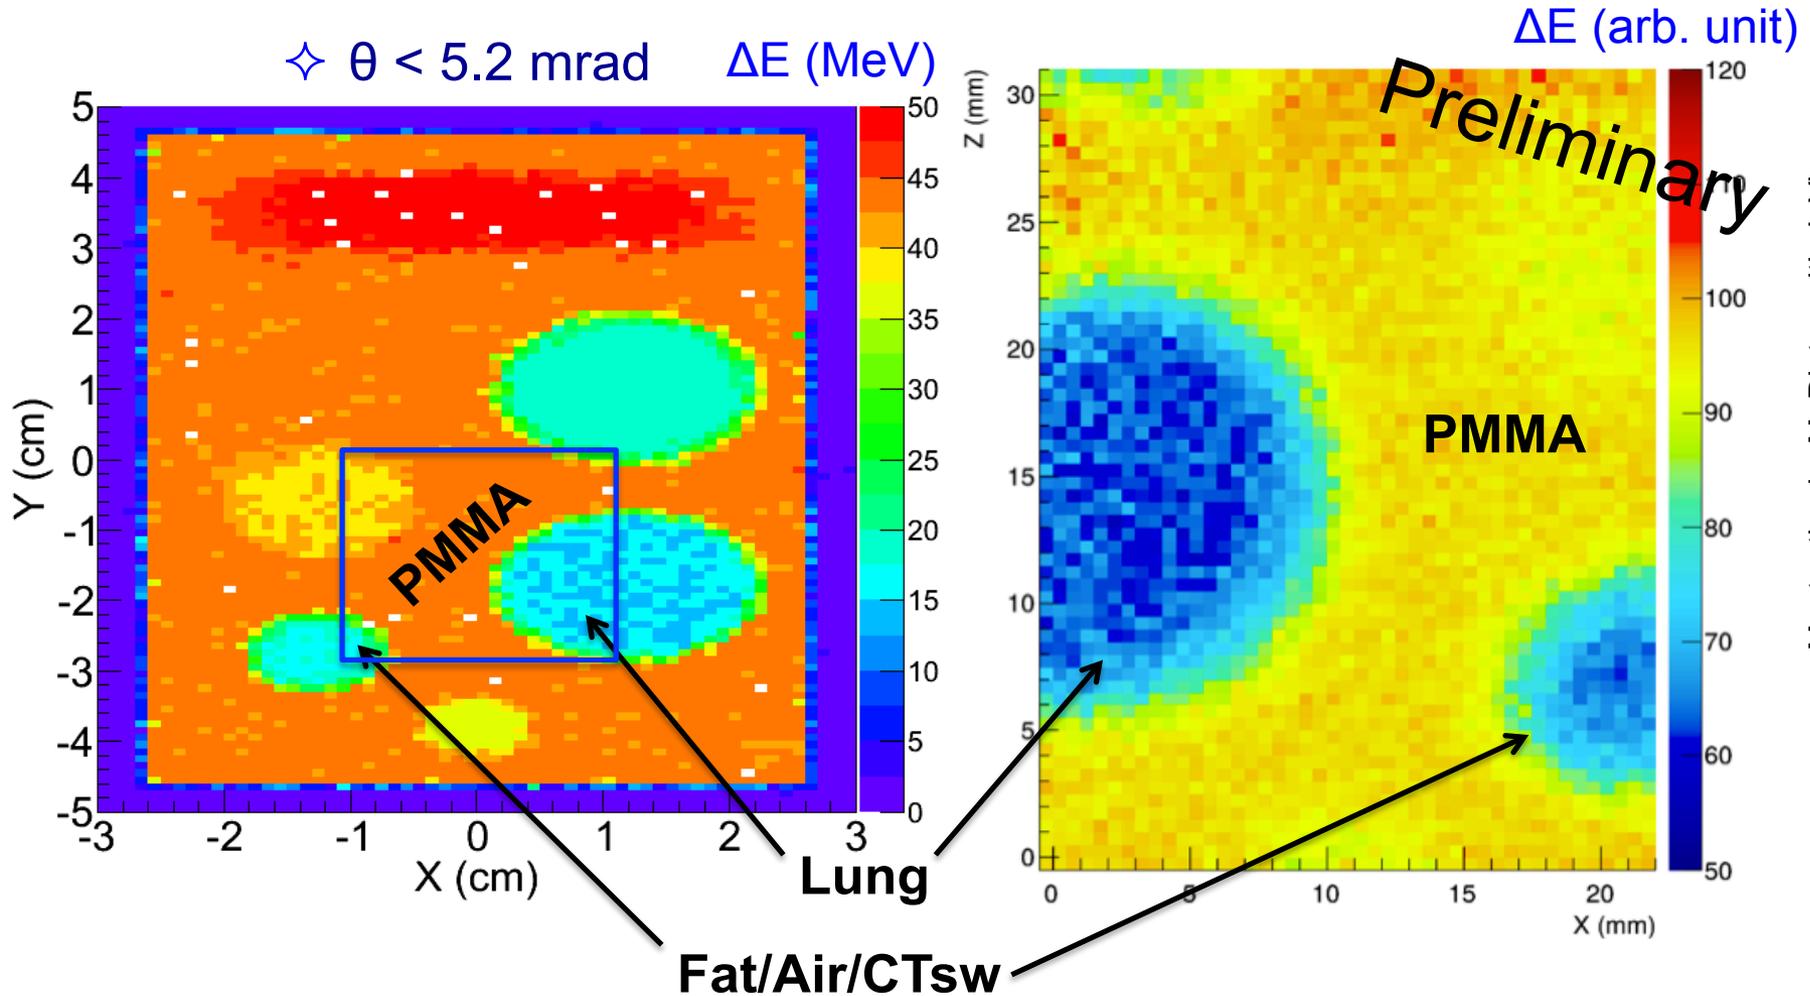

Energy loss reconstruction: Sims vs. Exp'2015

Master thesis: M. Dietze with J. Visser,
M. van Beuzekom, E. Koffeman (Nikhef June 2016)

◇ Phantom only partially covered by Timepix3-based TPCs (3.0×3.0 cm²)

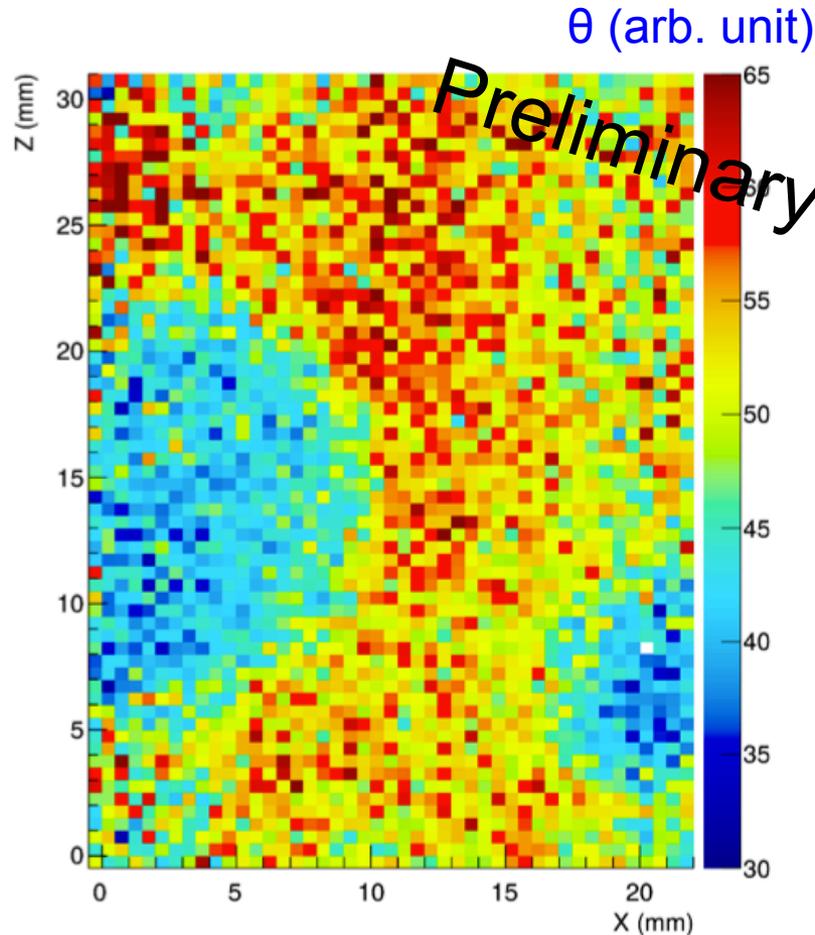

Energy loss reconstruction: Sims vs. Exp'2015

Master thesis: M. Dietze with J. Visser,
M. van Beuzekom, E. Koffeman (Nikhef June 2016)

Simulations and experimental results comparable

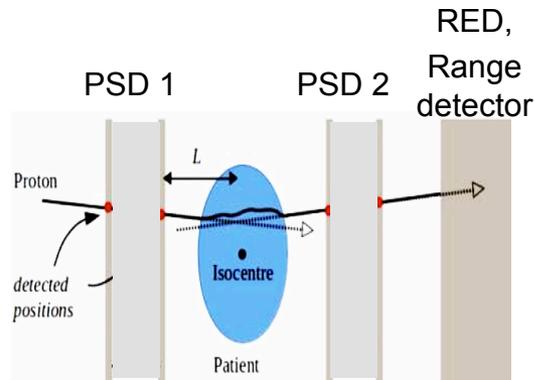

Scattering angle reconstruction: Exp'2015

Master thesis: M. Dietze with J. Visser,
M. van Beuzekom, E. Koffeman (Nikhef June 2016)

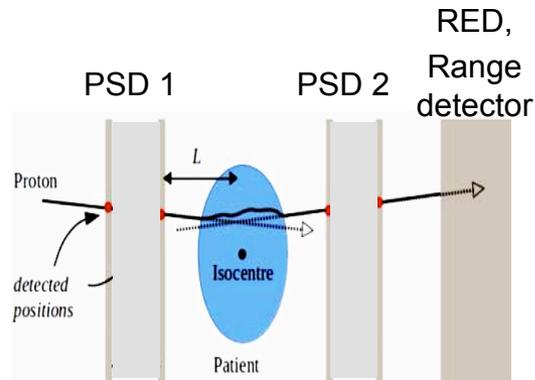

Scattering angle well reconstructed, but more statistics needed

✧ Trend towards Si tracking detectors
→ very fast

✧ Different approaches for energy/range detectors

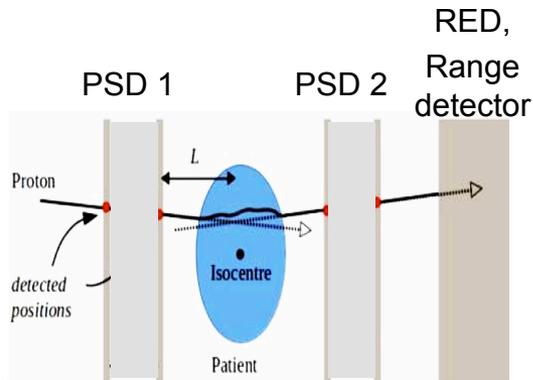

✧ Count rate close to what is required

But...

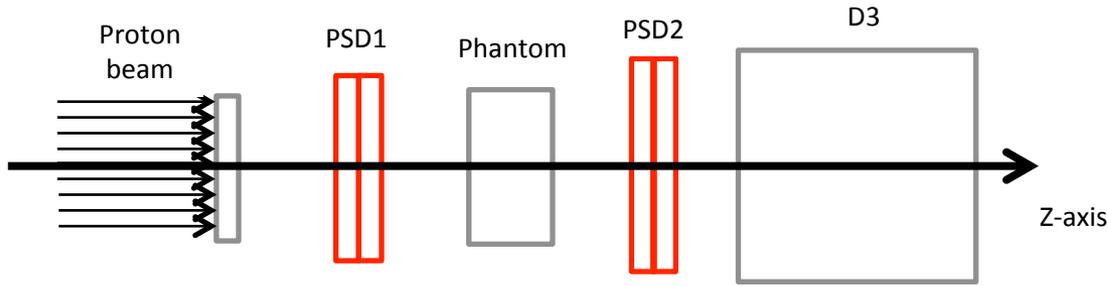

- ✧ Si ($Z=14$, $\rho=2.33 \text{ g/cm}^3$)
→ Multiple Coulomb Scattering already in the detector material
- ✧ Range detector does not give yet accurate enough residual energy important for proton stopping powers determination of an object

Simulations for:

Scattering angle θ_{12} of protons

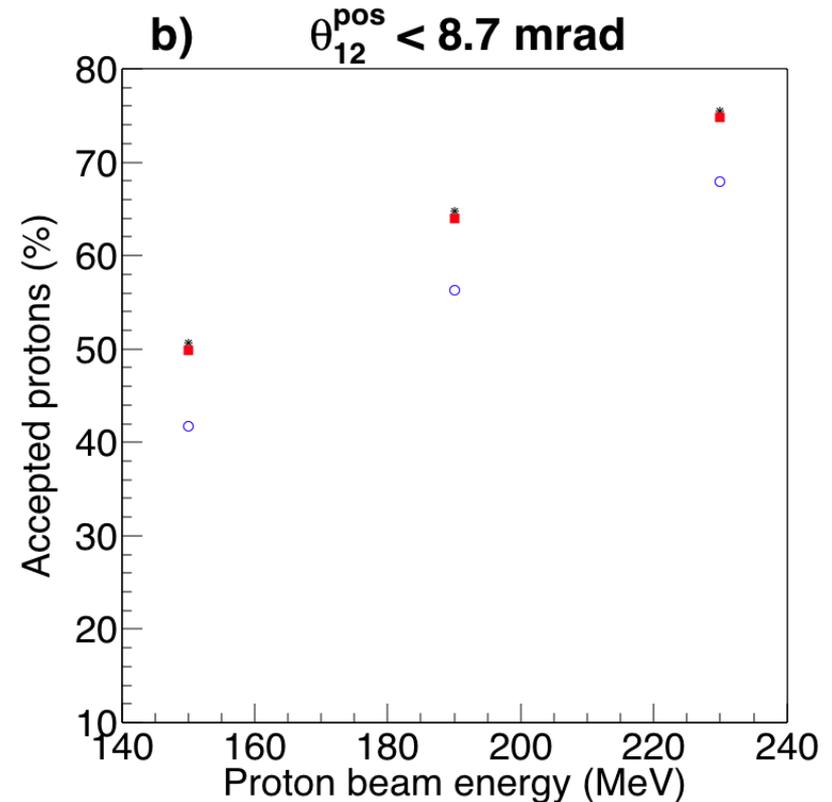

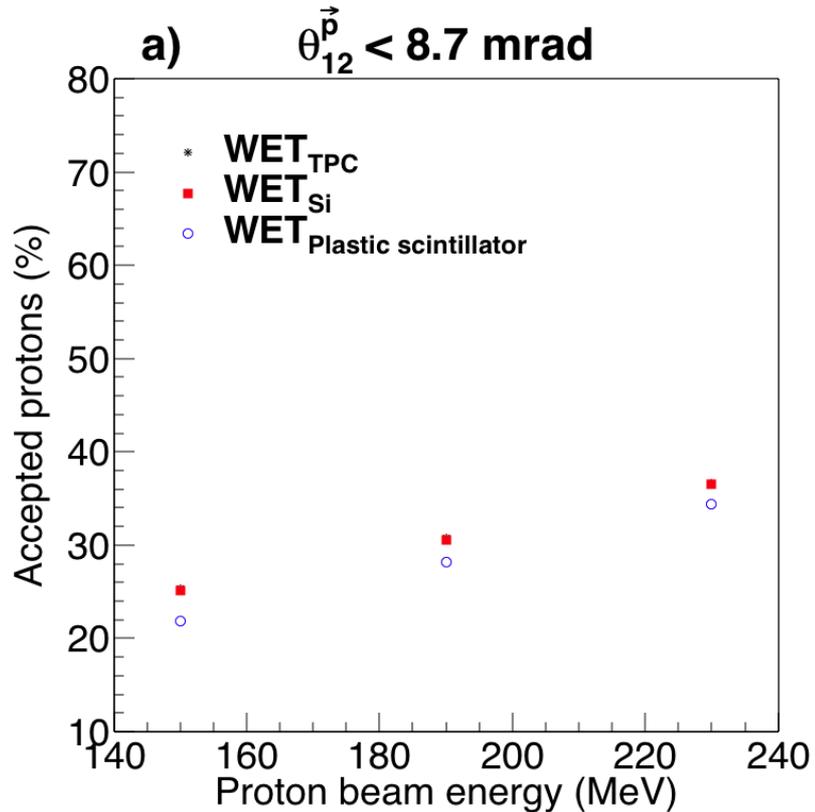

$$\phi_{12}^p(\text{rad}) = \cos^{-1} \frac{\vec{p}_1 \cdot \vec{p}_2}{|\vec{p}_1| |\vec{p}_2|}$$

$$\phi_{12}^{\text{pos}}(\text{rad}) = \tan^{-1} \frac{\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}}{(z_2 - z_1)}$$

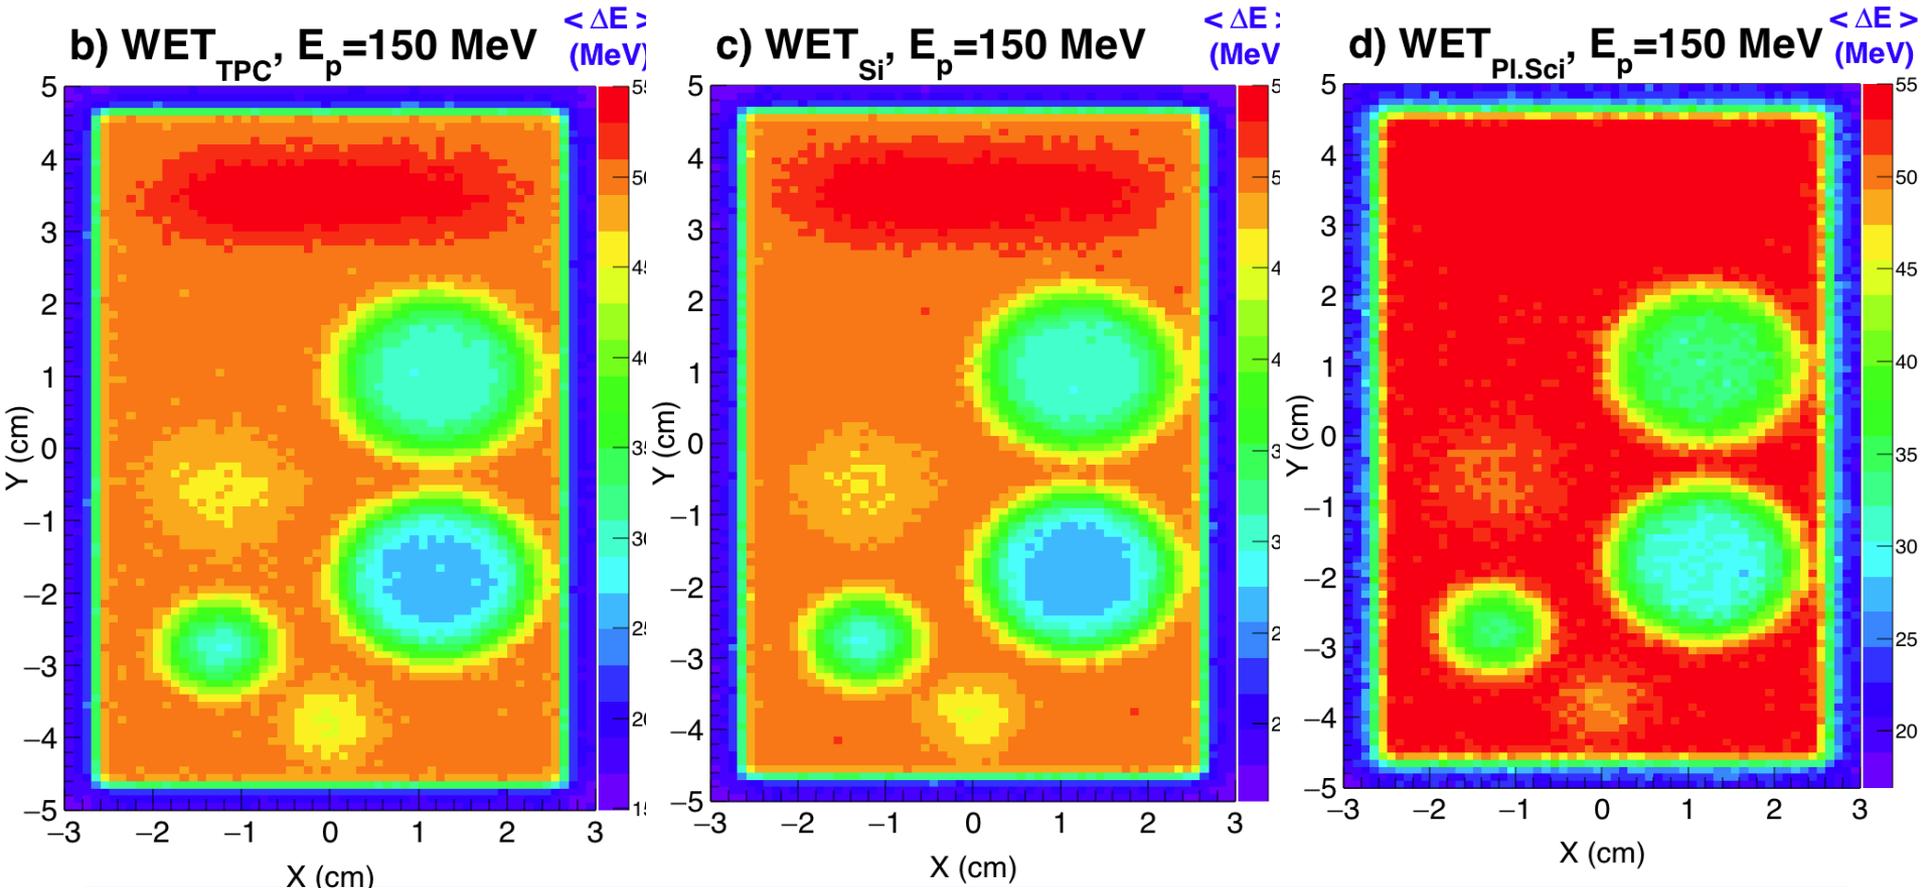

Geant4 simulations

Statistics @ $E_p = 150, 190$ and 230 MeV

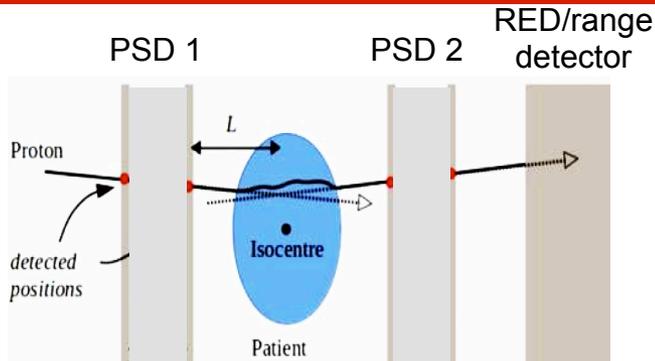

Using *position* of protons to calculate θ_{12} more protons, by factor of 2,
 are accepted to build the radiographic image

Energy loss radiographs for various PSDs

WET_{TPC} allows to reconstruct the best radiographic image

G. Poludniowski et al., *Br J Radiol* (2015) **88**:20150134

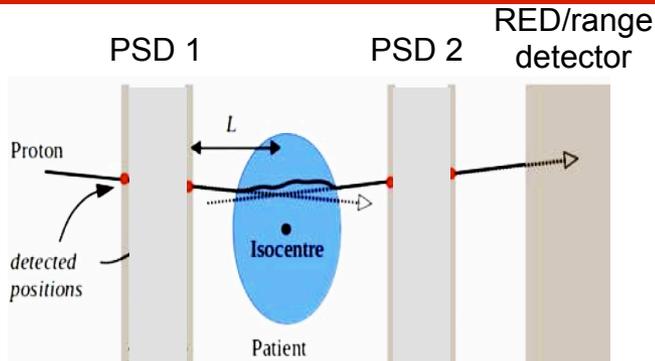

✓ Tracking detectors

- **Low Z and WET** → minimum MCS in a detector
- **Fast** → high count rate (> MHz), based on Timepix3/Timepix4, time resolution ~ns
- **Spatial resolution** → 50 μm
- **Full proton track** determination
- **Modular** → ultimate size 30x30 cm²

✓ Residual energy detector

- **Fast** scintillator (YAG:Ce, LaBr₃)
- **Good energy resolution** (up to 1%)
- **High count rate** (> MHz)

Ideal system with tracking detectors

G. Poludniowski et al., *Br J Radiol* (2015) **88**:20150134

✓ **Easy to mount on a gantry in proton therapy centers**

✓ **Scan time + reconstruction in a clinic of up to 10 s**

Needs to be clinically acceptable!

✓ Tracking detectors

- **Low Z and WET** → minimum MCS in a detector
- **Fast** → high count rate (> MHz), based on Timepix3/Timepix4, time resolution ~ns
- **Spatial resolution** → 50 μm
- **Full proton track** determination
- **Modular** → ultimate size 30x30 cm²

✓ Residual energy detector

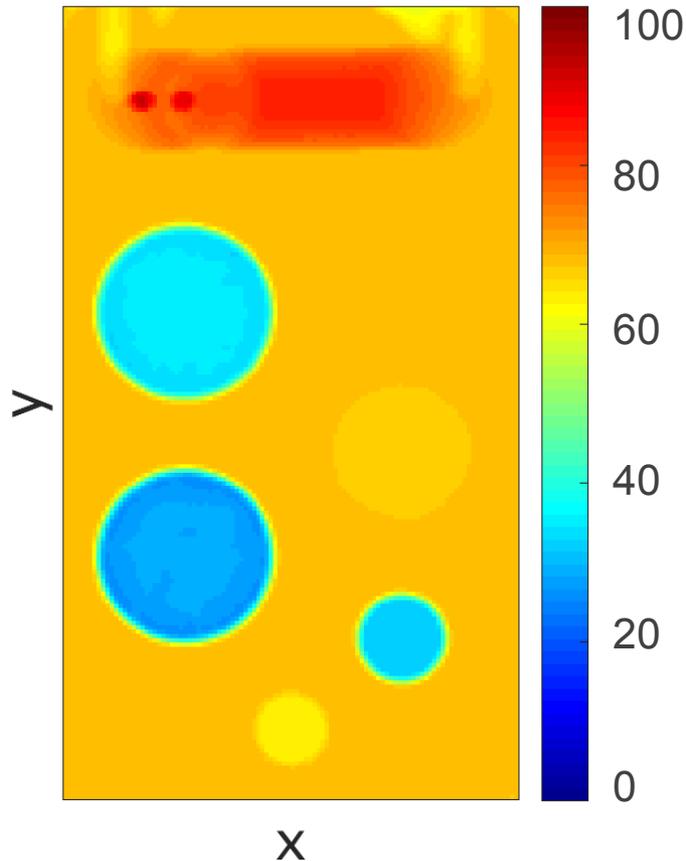

- **Fast** scintillator (YAG:Ce, LaBr₃)
- **Good energy resolution** (up to 1%)
- **High count rate** (> MHz)

Calibration of Relative Proton Stopping Powers

✧ X-ray CT @120 kVp

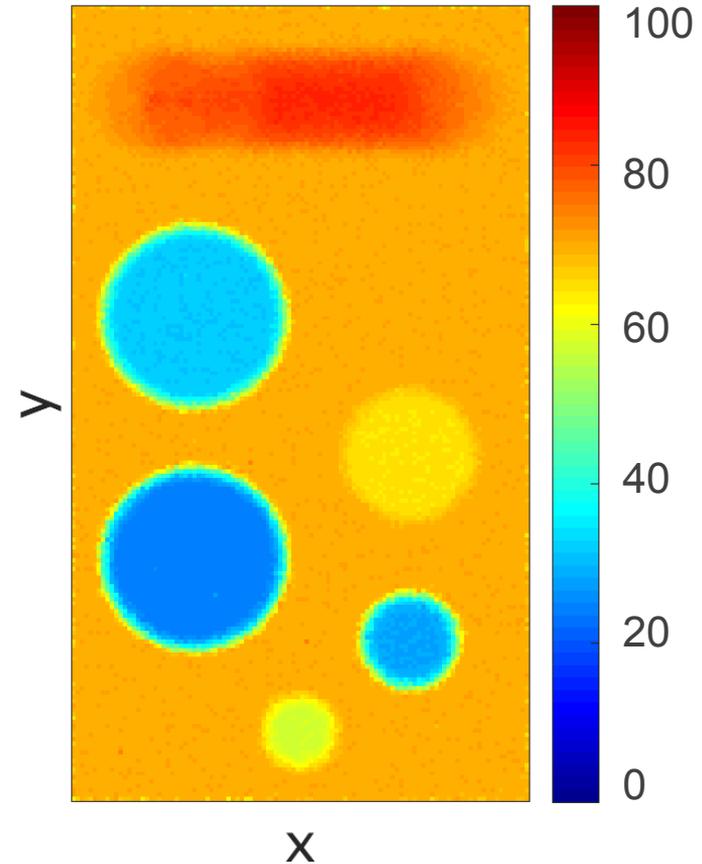

$$WEPL_{DRR(x,y)} = \sum_z \rho_s(HU_{SC}(x,y,z))\Delta z$$

WEPL_{DRR} (mm)

✧ Proton radiography:
 protons scattered < 5.2 mrad

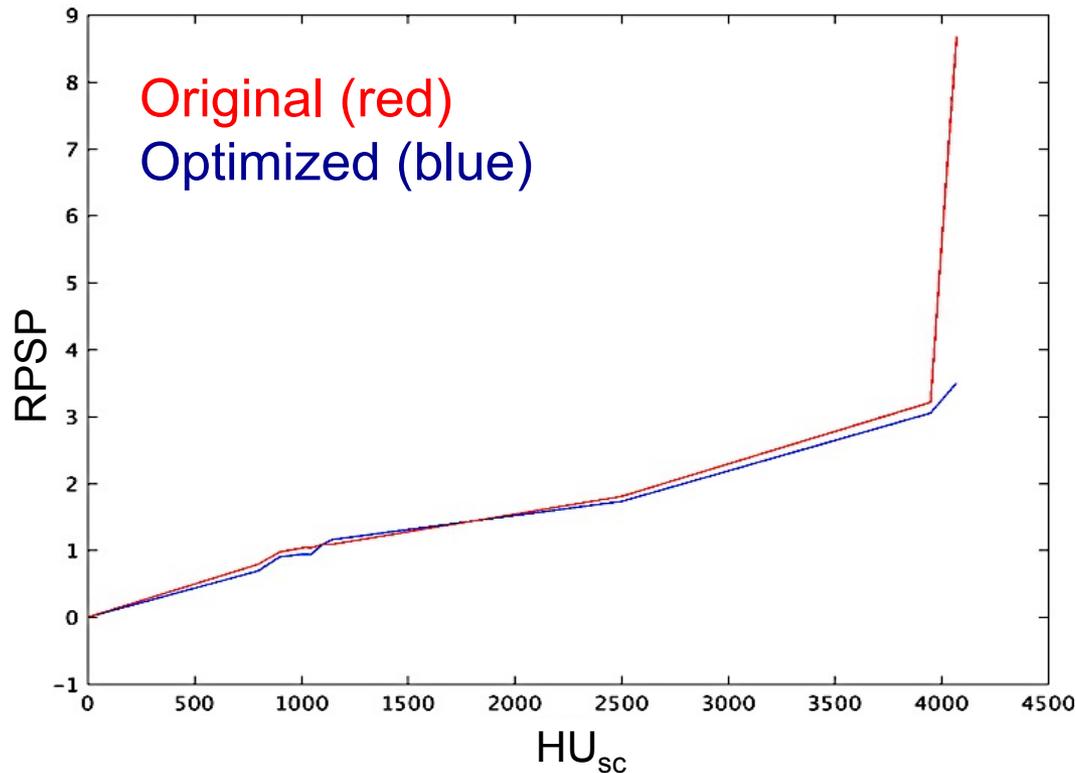

WEPL_{pRG} (mm)

Optimization of the clinical calibration curve

$$\text{RMSE} = \sqrt{\frac{\sum_{x,y} (\text{WEPL}_{\text{DRR}}(x,y) - \text{WEPL}_{p\text{RG}}(x,y))^2}{N}}$$

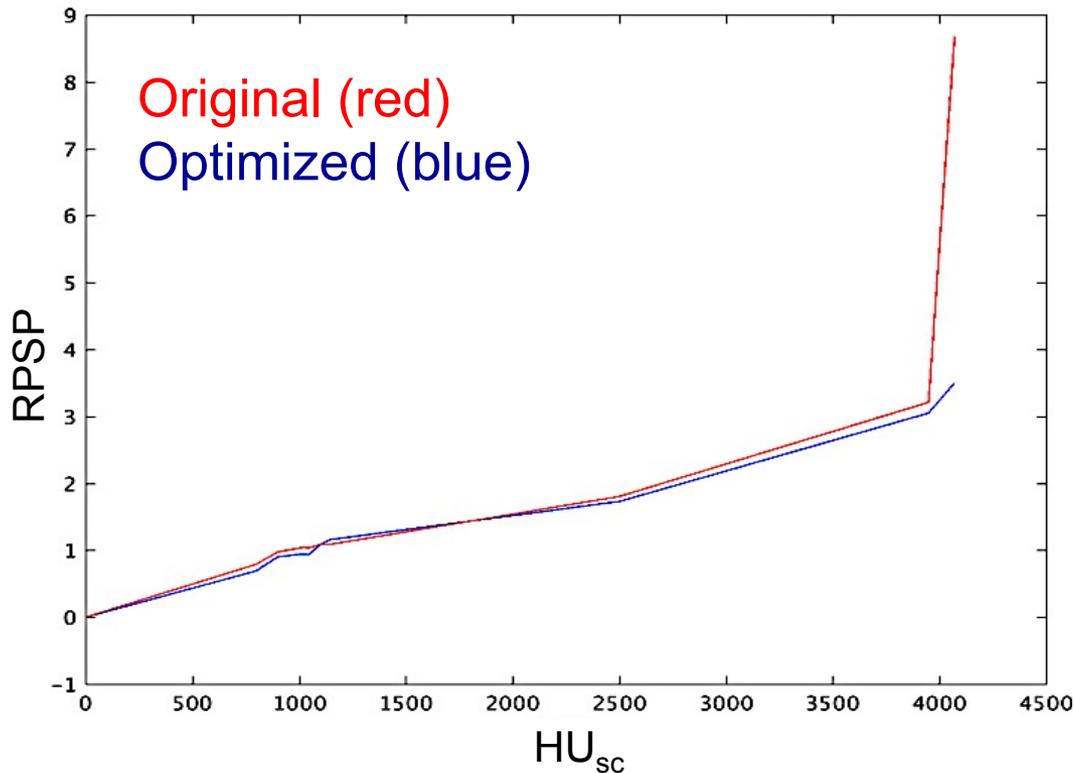

$$\chi^2 = \sum_{x,y} \frac{(\text{WEPL}_{\text{DRR}}(x,y) - \text{WEPL}_{p\text{RG}}(x,y))^2}{\text{WEPL}_{p\text{RG}}(x,y)}$$

Optimization of the clinical calibration curve

$$\text{RMSE} = \sqrt{\frac{\sum_{x,y} (\text{WEPL}_{\text{DRR}}(x,y) - \text{WEPL}_{p\text{RG}}(x,y))^2}{N}}$$

$$\chi^2 = \sum_{x,y} \frac{(\text{WEPL}_{\text{DRR}}(x,y) - \text{WEPL}_{p\text{RG}}(x,y))^2}{\text{WEPL}_{p\text{RG}}(x,y)}$$

Before optimization

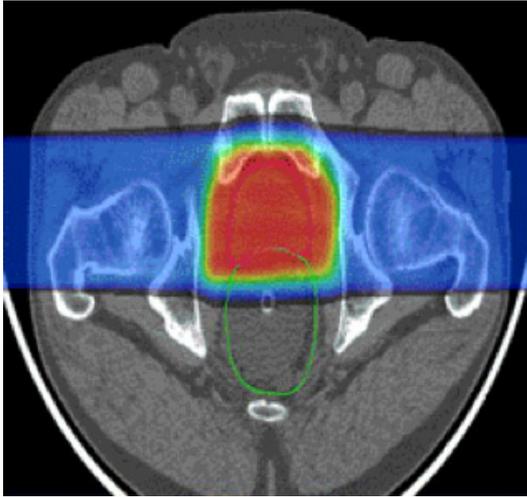

Metric	With PMMA
RMSE	3.59 mm
χ^2	5083.80

After optimization

Metric	With PMMA
RMSE	2.36 mm (-34.33%)
χ^2	2287.10 (-55.01%)

Geant4 simulations

Fast and compact detection system with:

- Spatial and angular resolutions
 - Energy resolutions
- Compatible with reconstruction algorithms

to deliver an accurate map of proton stopping powers of the patient
to fully benefit from proton therapy

<http://tcr.amegroups.com/article/view/5403/html>

Simulations

- ◆ Further analysis of the alternative approach for θ is necessary, also for more realistic phantoms and real patient CT data
- ◆ Realistic tracking detectors need to be implemented in simulations

Experimental work

- ✧ Development of Timepix-based TPC is needed to achieve clinically relevant count rates ($> \text{MHz}$)
- ✧ Fast energy detector with energy resolution $< 1\%$ should be considered

Both simulations and experimental work are necessary to have a proton radiography system relevant and accepted in hospitals!

Detection system:

Position detectors:

- (1) Improved data acquisition for Timepix3 (fast & compact) → **MHz rate**
- (3) Increase the size of the detectors (sufficient in clinics) → **100 x 100 mm²**
- (4) 3D information of the proton tract with a good position resolution (good angle reconstruction) → **50 μm**

Energy:

- (1) Fast energy detector → **MHz rate**
- (2) Energy resolution → **≤ 1%**

✧ Advantage:

Proton stopping powers measured directly

Decrease uncertainty of Relative PSP (RPSP)
 derived from stoichiometric calibration with X-ray CT

Optimize treatment plan for the patient

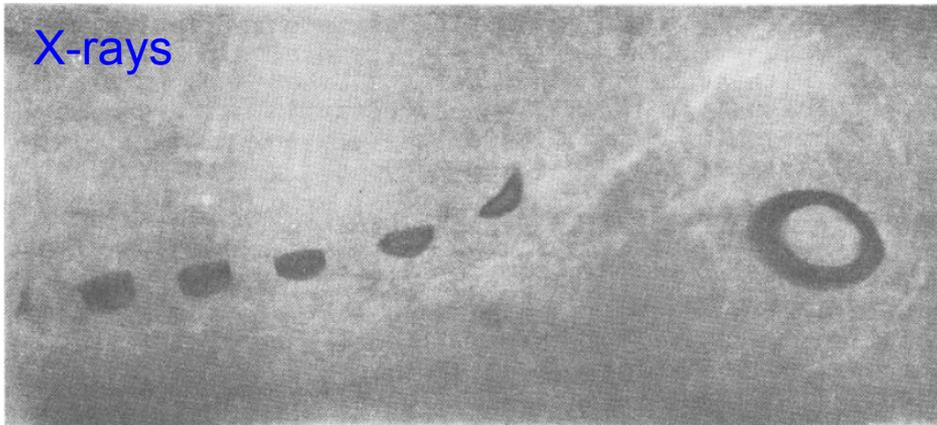

✧ Challenge:

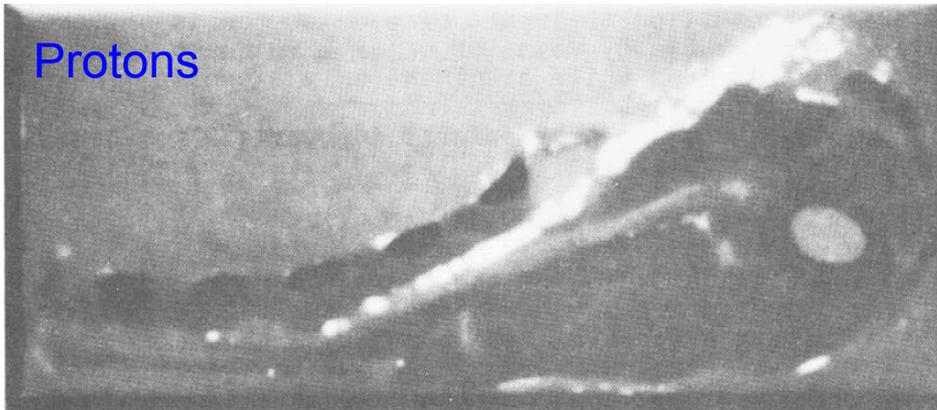

Proton undergoes multiple Coulomb scattering causing image blurring

Why proton radiography?

- ✧ A lamb chop 1 cm thick immersed in 12.5 cm thick water phantom
- ✧ $E_{\text{X-rays}} = 30 \text{ kVp}$
- ✧ $E_{\text{p}} = 160 \text{ MeV}$

- (-) much less contrast for fat
- (-) no contrast for lean meat (muscle)
- (+) much better spatial resolution

- (-) poor spatial resolution
- (+) high contrast for soft tissues

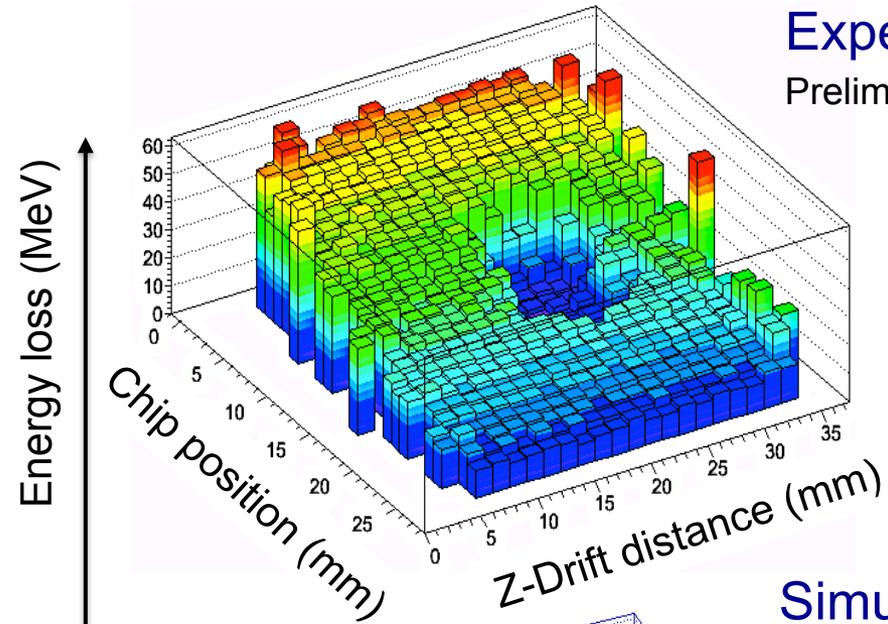

Reconstruction of imaged object: trapezoid

Scattered proton beam
 of 30 x 30 mm² size

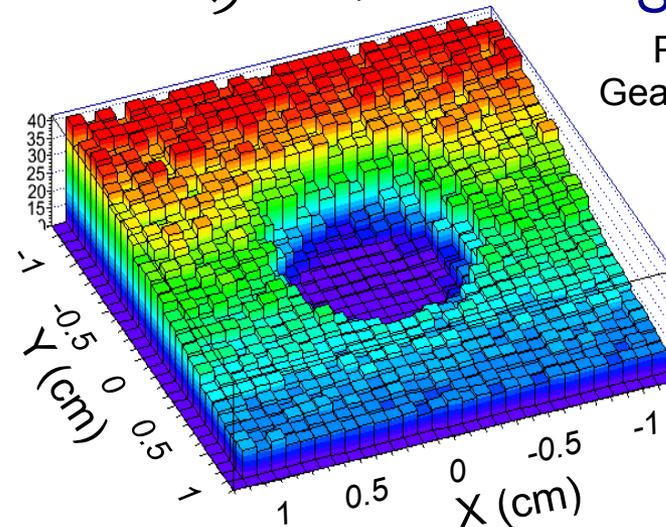

Brass trapezoid $\rho = 8.55 \text{ g/cm}^3$
 Polymer $\rho = 1.18 \text{ g/cm}^3$

Experiment
 Preliminary data

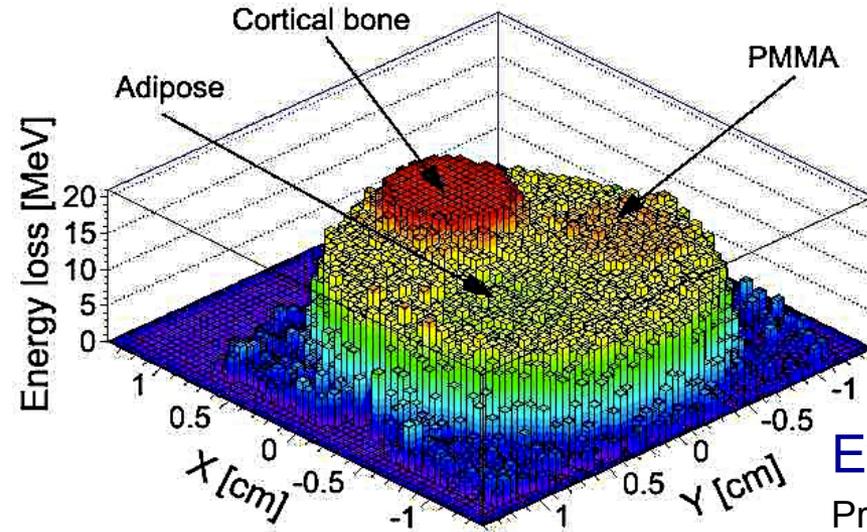

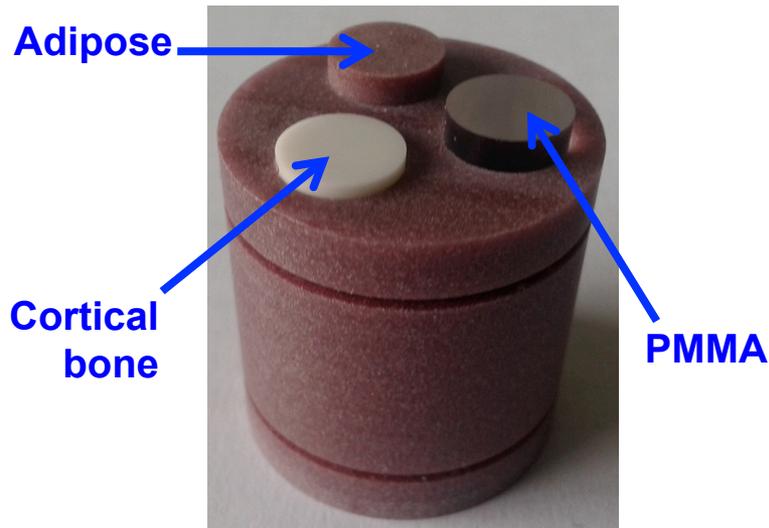

Simulations
 Performed with
 Geant4-based MC

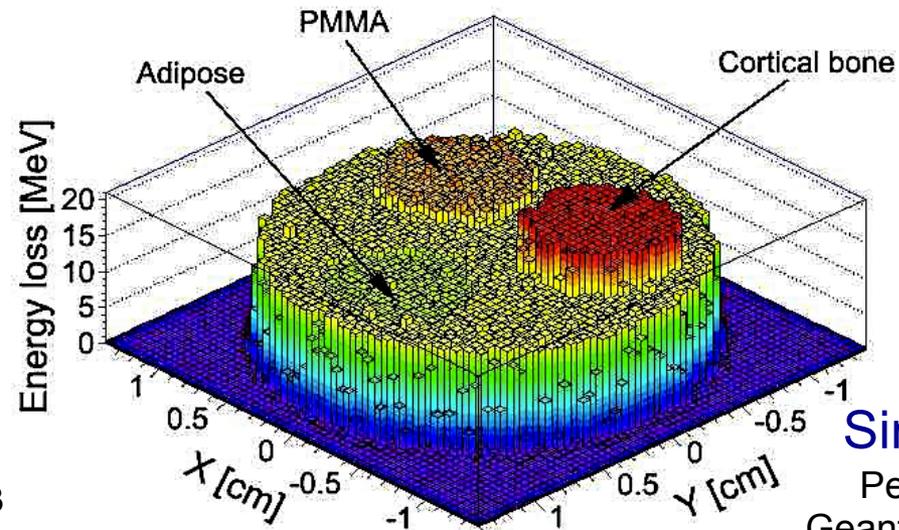

Reconstruction of object with tissue-like inserts

Scattered proton beam
of 30 x 30 mm² size

Experiment
